Answer: A

Explanation:

In Salesforce Apex development, the "Best Practice" for retrieving Record Type IDs is to avoid SOQL queries and instead use the Schema Describe methods. Option D utilizes Schema.SObjectType.Opportunity.getRecordTypeInfoByName(), which retrieves metadata directly from the application's local cache.

There are three primary reasons why Option D is superior to the others:

* Governor Limits: Salesforce imposes a strict limit of 100 SOQL queries per synchronous transaction.

Options A and C consume one of these limited queries just to fetch metadata. In a complex environment where many triggers and flows execute, "saving" SOQL for actual business data is crucial. Describe calls do not count against SOQL limits.

* Performance: Fetching data from the metadata cache is significantly faster than executing a database query, leading to lower CPU usage and faster trigger execution.

* Data Integrity: Option B is a common anti-pattern that will result in a runtime error. In an Apex Trigger, the Trigger.new list only contains the fields of the object itself. It does not include related fields (cross-object fields) like RecordType.Name. Accessing o.RecordType.Name directly would return null or cause a "System.ObjectException: SObject row was retrieved via SOQL without querying the requested field." By using the Schema class, the developer ensures that the code is bulk-safe, performant, and does not hardcode IDs, which can vary between Sandboxes and Production environments.

- A. プロセスビルダー
- B. 頂点 REST
- C. アベックストリガー
- D. 外部 JavaScript ライブラリ
