mpls ldp advertise-labels for 10 to 20
end
  
```

- A. Option A
- B. Option D
- C. Option C
- D. Option B

Answer: A

NEW QUESTION # 123

Refer to the exhibit. MPLS is running in the network with OSPF as the IGP. Full routes are shared between the routers, and each connected link has an MPLS neighbor relationship. A network engineer must update the network configuration so that it will maintain LDP neighbor relationships if a directly connected link goes down. Which action must the engineer take as part of the process?

- A. Implement Unified MPLS to unify the OSPF areas.
- **B. Implement LDP session protection on the network.**
- C. Implement MPLS OAM with BFD on the links.
- D. Implement LDP sync on links with a greater risk of faults.

Answer: B

Explanation:

LDP session protection ensures that Label Distribution Protocol (LDP) neighbor relationships are maintained even if a directly connected link goes down. This is achieved by enabling targeted LDP hellos, allowing the LDP session to persist over an alternate path if a direct link fails. This configuration is particularly useful in MPLS networks where maintaining label bindings during failures is critical for uninterrupted service. By implementing LDP session protection, the network can provide enhanced resilience and prevent disruption to MPLS traffic.

NEW QUESTION # 124

How much must the MTU be increased when configuring the 802.1q VLAN tag?

- A. 12 bytes
- B. 2 bytes
- **C. 4 bytes**
- D. 8 bytes

Answer: C

Explanation:

When configuring the 802.1q VLAN tag, the MTU must be increased by 4 bytes. This is because the 802.1Q tag adds an additional header to the Ethernet frame, which includes information such as the VLAN ID and priority. To accommodate this extra header without fragmenting the packet, the MTU must be increased accordingly. Reference: Configure 802.1Q VLAN Tagging, 802.1q and MTU.

NEW QUESTION # 125

Refer to the exhibit. Router 1 was experiencing a DDoS attack that was traced to interface gigabitethernet0/1. Which statement about this configuration is true?

```
ip cef
interface gigabitethernet0/1
ip verify unicast source reachable-via any
```

- **A. Router 1 accepts source addresses that have a match in the FIB that indicates it is reachable through a real interface**
- B. Router 1 drops all traffic that ingresses interface gigabitethernet0/1 that has a FIB entry that exits a different interface
- C. Router 1 accepts all traffic that ingresses and egresses interface gigabitethernet0/1
- D. Router 1 accepts source addresses on interface gigabitethernet0/1 that are private addresses

Answer: A
