Acquia Certified Drupal Site Builder Exam for Drupal 10, 11 Sample Questions (Q25-Q30):

NEW QUESTION # 25

You are building a gaming site where users are teamed based on their favorite weapon. How will you provide the ability for users to select their favorite weapon?

- A. In Account settings, go to Manage fields and add field for "Favorite weapon"
- B. Create a vocabulary with a list of weapons as terms and check the "Display on user profile" checkbox.
- C. Create a Content Type "Weapons" and create a view. Show this view on /user.
- D. Create a Content Type "Users" which has "Favorite Weapon" field. Use the content type as user profiles.

Answer: A

Explanation:

In Drupal 10 and Drupal 11, user accounts are fieldable entities, which means you can add custom fields directly to user accounts through the administrative UI. Drupal's field documentation explains that fields can be added to various entity types, including users, not just content types. So if you want each user to choose a favorite weapon, the correct site-building approach is to add a field such as Favorite weapon to the User entity using the Manage fields interface for user accounts. This makes option A correct. This approach is also flexible. The field could be a plain list, an entity reference, or a taxonomy term reference if the site needs a controlled list of weapons. The important point is that the selection belongs to the user profile/account, because the requirement is about storing a preference for each user.

The other options are not the correct primary solution. Option B creates taxonomy terms but does not by itself provide the user-selection field. Option C uses content and Views instead of storing a value on user accounts.

Option D is incorrect because Drupal users are not modeled as a content type. Therefore, adding a field to user accounts is the proper Drupal-native solution.

NEW QUESTION # 26

You manage an online store which sells digital photos. The site hosts thousands of photos from multiple categories. Each photo has a unique description. Your client has specified that the photo description should be stored along with the image file while adding images to the photo content type. The images can be reused on other pieces of content like landing pages, blog posts etc. How will you build the functionality to store image descriptions along with images? (Select 2 options)

- A. Create a media type with an image and the description field. Use the media reference field to link this with the content.
- B. Search for the contributed module for adding image descriptions, as Drupal can't provide this feature out of box.
- C. Create a content type which will have an image and description field, and link this to any content using the entity reference field.
- D. Add description field to the pre-existing image media type. Use the media reference field to link this with content.

Answer: A,D

Explanation:

Drupal's recommended solution for reusable images with their own metadata is to use Media entities, not ordinary image fields on content. Core documentation and issue work around Media in Drupal explain that moving from regular image fields to media image fields is what enables reuse of the same image asset across multiple pieces of content.

That means the description should live on the media item itself, together with the image, and content types should reference that media item through a media reference field. Drupal field documentation also confirms that fields can be attached to entities and reused appropriately through references. So creating a new media type with an image field plus a description field is valid, and adding a description field to an existing Image media type is also valid. Both approaches satisfy the requirement that the image and its description stay together and can be reused elsewhere.

Option B is incorrect because Drupal core already provides Media for this use case. Option C is not the best content model because a content type represents publishable content, while reusable images-with-metadata are better modeled as Media assets.

NEW QUESTION # 27

You are building a Drupal site for a company which has two content types, Page and Article. The layout of the content region on both the content types needs to be different. Page content type needs to have a three-column layout for the content section whereas the Article content type needs to use a two-column layout.

How will you build this functionality assuming all the core modules on the site are enabled?

- A. Add field groups named two-column and three-column in respective content types and organize fields in the field groups. Add appropriate layout styles in your theme.
- B. For each content type, enable "Use Layout Builder" in layout options on the Manage display tab and also check the "Allow each content item to have its layout customized" option.
- C. While defining the content types, select the two-column layout or three-column layout as appropriate while adding the fields.
- D. For each content type, enable "Use Layout Builder" in layout options on the Manage display tab and select appropriate two-column / three-column layouts for the content types.

Answer: D

Explanation:

The correct answer is D. Drupal core's Layout Builder is specifically designed to let site builders create different display layouts for different bundles, including content types such as Page and Article. The official Layout Builder documentation explains that it can be used to create layouts for content types and other entity types, and that layout defaults apply to all items of a given bundle. That

matches this scenario exactly: one content type needs a default three-column layout and another needs a default two-column layout. Option B is not the best answer because the extra setting "Allow each content item to have its layout customized" enables layout overrides for individual nodes. The question asks for different layouts by content type, not per individual content item, so overrides are unnecessary. Drupal documentation states that layout overrides are optional and are only needed when each entity may differ from the bundle default.

Option A is incorrect because field grouping and theme styling are not the Drupal core mechanism for bundle-level visual page layouts. Option C is also incorrect because content types are not assigned page layouts during field creation. In Drupal core, this is handled later through Manage display with Layout Builder enabled for each content type.

NEW QUESTION # 28

The UX team has suggested that "Social share" buttons currently visible in the sidebar region should be moved to the footer. The Social share buttons are implemented in a custom block.

How should you make the requested changes?

- A. For each content type, use the Layout Builder module's "manage layout" feature to reassign the block from the Sidebar region to the Footer region.
- **B. From the block layout admin page, drag the existing block from the Sidebar region to the Footer region.**
- C. Using the "Basic page" content type's "Manage display" interface, drag the existing block from the Sidebar region to the Footer region.
- D. From the "Appearance" admin page, reconfigure the site's theme to place the block in the Footer region instead of the Sidebar.

Answer: B

Explanation:

In Drupal 10 and Drupal 11, blocks are placed and managed through the Block Layout system available at Structure # Block layout. Each theme defines regions such as Sidebar, Footer, Header, etc., and administrators can assign blocks to these regions.

Since the "Social share" buttons are implemented as a custom block, the correct approach is to reposition the block using the Block Layout admin interface. This interface allows site builders to move blocks between regions either by dragging or by editing the block's region setting. This matches Drupal's documented site-building practice for managing block placement.

Option A is incorrect because Manage display is used for configuring how fields are displayed on entities, not for block placement.

Option C is incorrect because the Appearance page controls themes, not individual block placement. Option D is unnecessary because Layout Builder is used for per-content or per-entity layouts, not for globally placed blocks like a social share block.

Therefore, the simplest and correct solution is to move the block via the Block Layout page, making option B correct.

NEW QUESTION # 29

A page has been added for a new product, and the marketing team wants you to add it to the main navigation menu, as a child of the "Products" page. During a promotion period, the team also wants you to add a link to the new page as a child of the "What's New" page.

What is the best way to add both links to the main navigation menu?

- A. Edit the new page, add a link in Menu Settings, and select "Products" as the Parent item. Clone the new page, and set the menu link parent to the "What's New" page. When the promotion is over, delete the cloned page.
- B. In the Main navigation menu, add two links to the new page, one with "Products" as the parent page and the other with "What's New" as the parent page. Set the second link to expire on the date the promotion ends.
- **C. Edit the new page, add a link in Menu Settings, and select "Products" as the Parent item. In the Main navigation menu, add a new link to the page and select "What's New" as the parent item. When the promotion is over, delete the second link from the menu.**
- D. Edit the new page and create two links in the Menu Settings section, one with "Products" as the parent page and the other with "What's New" as the parent page. When the promotion is over, delete the second menu link.

Answer: C

Explanation:

In Drupal 10 and Drupal 11, each content item (node) can only have one menu link created through its Menu settings. Drupal documentation explains that the Menu settings section allows you to place a node in a menu, but only as a single menu item.

Therefore, you cannot create two menu links for the same node directly from the node edit form, which makes option D incorrect.

The correct approach is to create one menu link via the node's Menu settings (placing it under "Products"), and then manually add an additional menu link in the Menu administration (Structure # Menus # Main navigation) that points to the same node but is placed

under "What's New." This matches option A. After the promotion, the temporary menu link can be removed. Option B is incorrect because duplicating content creates unnecessary redundancy and breaks content management best practices. Option C is incorrect because Drupal core does not provide a built-in "menu link expiration" feature. Thus, Drupal's recommended method is to create one menu link via the node and another manually via the menu UI, making A the correct answer.

NEW QUESTION # 30

.....

Candidates can also check the explanations for the answers to have more understanding of the Acquia Drupal-Site-Builder questions that are asked on the Drupal-Site-Builder practice test by Dumpexams. You can customize the Acquia Drupal-Site-Builder exam questions and time for the Drupal-Site-Builder practice exam on the software. Assessing their Acquia Drupal-Site-Builder Exam Preparation and speed on the practice exam software helps candidates in making required improvements and succeeding at the Acquia Drupal-Site-Builder exam. The software by Dumpexams gives the candidates the results and progress reports to help them monitor their performance for the Acquia Drupal-Site-Builder exam.
