WGU Cloud Deployment and Operations Sample Questions (Q33-Q38):

NEW QUESTION # 33

(Which AWS CloudFormation feature should be used to specify the AWS resources to be provisioned?)

- A. Exports
- **B. Template**
- C. StackSet
- D. Change set

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The CloudFormation template feature should be used to specify the AWS resources to be provisioned. A template is a JSON or YAML file that defines the resources (e.g., EC2 instances, S3 buckets) and their configurations for deployment. The WGU Cloud Deployment and Operations Study Guide (Section 5.3, CloudFormation Templates) states, "The template is the core component of CloudFormation, containing the resource specifications and properties that are provisioned when a stack is created." Change sets, exports, and stack sets serve different purposes (e.g., previewing changes, sharing outputs, managing multiple stacks).

NEW QUESTION # 34

(Which AWS solution can be used to send events from Shopify?)

- A. CloudTrail events
- **B. EventBridge**
- C. IoT Events
- D. Service events

Answer: B

Explanation:

Amazon EventBridge is the AWS solution that can be used to send events from external sources like Shopify.

EventBridge supports integration with third-party applications through its event bus, allowing custom events (e.g., from Shopify via webhooks) to be ingested and routed to AWS services or targets. The WGU Cloud Deployment and Operations Study Guide (Section 4.3, EventBridge) notes that EventBridge is designed for event ingestion from SaaS applications, making it suitable for

Shopify integration. CloudTrail, IoT Events, and Service events are not designed for this purpose.

NEW QUESTION # 35

(Which two solutions should an administrator use to receive emails when a Lambda function returns an error?
Choose 2 answers.)

- A. Amazon CloudWatch
- B. Amazon Simple Queue Service
- C. Amazon Simple Notification Service
- D. AWS CloudTrail

Answer: A,C

Explanation:

To receive emails when a Lambda function returns an error, the administrator should use Amazon CloudWatch to monitor the function's logs and metrics (e.g., errors) and Amazon Simple Notification Service (SNS) to send email notifications based on CloudWatch alarms. The WGU Cloud Deployment and Operations Study Guide (Section 4.3, CloudWatch and SNS) states, "CloudWatch can detect Lambda errors via logs and trigger an alarm, which integrates with SNS to send email notifications to subscribed endpoints, ensuring timely error alerts." SQS and CloudTrail are not designed for this notification workflow.

NEW QUESTION # 36

(Which service should be used to horizontally scale Amazon EC2 instances?)

- A. Elastic IPs
- B. Elastic network interface
- C. Elastic Load Balancing
- D. Elastic Beanstalk

Answer: C

Explanation:

Elastic Load Balancing (ELB) should be used to horizontally scale Amazon EC2 instances by distributing incoming traffic across multiple instances, improving availability and fault tolerance. ELB works in conjunction with Auto Scaling groups to add or remove instances based on demand. The WGU Cloud Deployment and Operations Study Guide (Section 3.2, Elastic Load Balancing) notes, "Elastic Load Balancing distributes traffic across EC2 instances, enabling horizontal scaling as part of an Auto Scaling group to handle increased load efficiently." Elastic IPs, elastic network interfaces, and Elastic Beanstalk do not provide this scaling functionality.

NEW QUESTION # 37

(Which function is used to obtain components defined in an AWS CloudFormation template?)

- A. ImportValue
- B. Ref
- C. Cidr
- D. GetAZs

Answer: B

Explanation:

The 'Ref' function in an AWS CloudFormation template is used to obtain values of components defined within the template, such as resource IDs, parameters, or outputs. This function allows dynamic referencing of resources during stack creation. The WGU Cloud Deployment and Operations Study Guide (Section 5.3, CloudFormation Functions) states, "The 'Ref' function is used to reference the logical IDs of resources, parameters, or mappings defined in the template, enabling dynamic value retrieval (e.g., 'Ref MyEC2Instance' returns the instance ID)." ImportValue is used for cross-stack references, Cidr for IP range calculations, and GetAZs for availability zone lists, making them unsuitable here.
