## CompTIA Linux+ Certification Exam Sample Questions (Q100-Q105):

### NEW QUESTION # 100

A Linux administrator is reviewing changes to a configuration file that includes the following section:

```
tls:
  certificates:
    - certFile: /etc/ssl/cert.cer
      keyFile: /etc/ssl/cert.key
      stores: default
    - certFile: /etc/ssl/expired.cer
      keyFile: /etc/ssl/expired.key
      stores: expired
```

The Linux administrator is trying to select the appropriate syntax formatter to correct any issues with the configuration file. Which of the following should the syntax formatter support to meet this goal?

- A. Markdown
- B. XML
- C. JSON
- **D. YAML**

**Answer: D**

Explanation:

Explanation

The configuration file shown in the image is written in YAML format, so the syntax formatter should support YAML to correct any issues with the file. YAML stands for YAML Ain't Markup Language, and it is a human-readable data serialization language that uses indentation and colons to define key-value pairs. YAML supports various data types, such as scalars, sequences, mappings, anchors, aliases, and tags. The configuration file follows the rules and syntax of YAML, while the other options do not. Markdown is a lightweight markup language that uses plain text formatting to create rich text documents. XML is a markup language that uses tags to enclose elements and attributes. JSON is a data interchange format that uses curly braces to enclose objects and square brackets to enclose arrays. #### NEW QUESTION # 101

Which of the following will prevent non-root SSH access to a Linux server?

- A. Creating the /etc/nologin.allow file containing only a single line root
- B. Creating the /etc/nologin/login.deny file containing a single line +all
- C. Ensuring that /etc/pam.d/sshd includes account sufficient pam\_nologin.so
- **D. Creating the /etc/nologin file**

**Answer: D**

Explanation:

This file prevents any non-root user from logging in to the system, regardless of the authentication method.

The contents of the file are displayed to the user before the login is terminated. This can be useful for system maintenance or security reasons<sup>12</sup>.

#### NEW QUESTION # 102

A systems administrator wants to test the route between IP address 10.0.2.15 and IP address 192.168.1.40.

Which of the following commands will accomplish this task?

- A. ip route 192.169.1.40 to 10.0.2.15
- B. route -n 192.168.1.40 from 10.0.2.15
- C. route -e get to 192.168.1.40 from 10.0.2.15
- **D. ip route get 192.163.1.40 from 10.0.2.15**

**Answer: D**

Explanation:

The command `ip route get 192.168.1.40 from 10.0.2.15` will test the route between the IP address 10.0.2.15 and the IP address 192.168.1.40. The `ip route get` command shows the routing decision for a given destination and source address. This is the correct command to accomplish the task. The other options are incorrect because they either use the wrong commands (`route` instead of `ip route`), the wrong options (`-e` or `-n` instead of `get`), or the wrong syntax (`to` instead of `from`). ### NEW QUESTION # 103

A systems administrator is gathering information about a file type and the contents of a file. Which of the following commands should the administrator use to accomplish this task?

- A. `grep filename`
- B. `ls -l filename`
- C. `file filename`
- D. `touch filename`

**Answer: C**

Explanation:

The `file` command is used to determine the type of a file by examining its contents. It can recognize many different formats, such as text, binary, executable, compressed, image, audio, video, etc. It can also display some additional information about the file, such as encoding, size, dimensions, etc. References: 1: `file(1)` - Linux manual page 2: How to use the `file` command in Linux

### NEW QUESTION # 104
