Pure Storage Certified FlashArray Implementation Specialist Sample Questions (Q74-Q79):

NEW QUESTION # 74

A customer has a FlashArray X20R3 with 22/22 data packs in the chassis at 80% space usage and wishes to swap one of the data packs for a 45TB pack. What step needs to be taken to facilitate this consolidation?

- A. Send a DirectFlash Shelf without any additional capacity.
- **B. Send a DirectFlash Shelf with a 63TB of temporary extra capacity.**
- C. Reduce array space usage to allow for the evacuation of the 22TB packs.

Answer: B

Explanation:

Adding a DirectFlash Shelf with sufficient temporary extra capacity (63TB) allows data to be evacuated from the smaller 22TB packs during the swap, enabling consolidation without reducing array usage beforehand.

NEW QUESTION # 75

Before installing array rails, where should the cage nuts be placed?

- A. Lowest square of top RU
- **B. Lowest square of lowest RU**
- C. Top square of the lowest RU

Answer: B

Explanation:

Cage nuts should be placed in the lowest square hole of the lowest rack unit (RU) where the array rails will be installed to ensure proper alignment and support.

NEW QUESTION # 76

An Implementation Engineer is performing a hardware NDU from a fully populated FlashArray//X90R3 to a FlashArray//XL that already contains 20 DFM-Ds. The drive transfer is complete, and the //XL is still in SPM (Shelf Personality Mode). What is the next step the Implementation Engineer should take to continue the upgrade?

- A. Run the purehw dmm migrate command to transfer cache state to the //XL.
- B. Evacuate DMMs as a data pack, then install into any open slot in the //XL.
- C. Hot swap and move each DMM into any open //XL slot without evacuation.
- **D. Evacuate and remove each DMM one-by-one, then set aside.**

Answer: D

Explanation:

Upgrading from a fully populated FlashArray//X90 R3 to a FlashArray//XL introduces a unique set of hardware migration challenges. To facilitate this massive transition, Pure Storage utilizes a feature called Shelf Personality Mode (SPM). In SPM, the legacy //X90 controllers temporarily act as a "dumb" NVMe-oF expansion shelf attached to the new //XL controllers, allowing the capacity drives to be transparently migrated without external swing hardware.

However, DirectMemory Modules (DMMs)-which are high-speed Storage Class Memory (SCM) drives used strictly for read caching-are handled differently than standard capacity DirectFlash Modules (DFMs).

DMMs do not hold persistent, uniquely resilient user data; they hold a volatile copy of hot read blocks.

While the system is still operating in Shelf Personality Mode, the official Hardware NDU procedure dictates that the Implementation Engineer cannot simply yank the DMMs out, nor can they be migrated collectively as a "data pack." Instead, the engineer must evacuate and remove each DMM one-by-one, and set them aside

. By initiating a manual evacuation on a DMM, Purity gracefully flushes the read cache mapping for that specific module. Once fully evacuated, the drive is safely removed from the legacy //X90 chassis. After the HWNDU is completely finished and the //XL is operating independently, the engineer can then re-insert those compatible DMMs into specific designated slots (typically slots 20-39) on the new //XL chassis to rebuild the cache tier.

NEW QUESTION # 77

A customer would like to consolidate their SAS shelves and wants to evacuate multiple shelves in parallel. What is a prerequisite for this procedure?

- A. The array chassis must be fully populated with modules.
- **B. The array usage percentage must be lower than 60%**
- C. Purity must be upgraded to 6.x

Answer: B

Explanation:

To evacuate multiple shelves in parallel safely during consolidation, the array's usage must be sufficiently low (under 60%) to ensure enough free capacity for data movement.

NEW QUESTION # 78

An Implementation Engineer is installing a second DirectFlash Shelf (DFS) on a FlashArray//XR4 controller. How should the Implementation Engineer complete the installation?

- A. Install a DFS card in PCIe Slot 0 and use these ports for Shelf connectivity.
- B. Install a DFS card in PCIe slot 4 and use it to connect the second DirectFlash Shelf.
- **C. Install a DFS card in PCIe slot 3 and use it to connect the second DirectFlash Shelf.**

Answer: C

Explanation:

The FlashArray//XR4 introduces a new chassis layout and PCIe slot numbering scheme compared to previous generations. For expansion connectivity, specific slots are designated for the backend SAS or Ethernet/RoCE fabric cards that connect to DirectFlash Shelves.

According to the //XR4 hardware guide and expansion best practices, PCIe slot 3 is the designated location for the additional expansion interface card required when adding a second DirectFlash Shelf (or for specific shelf configurations). Slots 0 and 1 are often reserved for host I/O or other functions, and slot numbering

/priority is strict to ensure the BIOS and Purity software correctly recognize the card function.

Installing the card in the wrong slot (like slot 0 or 4, if those are reserved for other uses or primary I/O) could result in the shelf not being detected, the array failing to boot, or suboptimal performance due to PCIe lane allocation. Therefore, the engineer must install the DFS expansion card into PCIe slot 3 and cable the second shelf to the ports on that specific card to ensure a supported and functional configuration.
