Exam Topics JN0-224 Pdf - Juniper Realistic Exam Topics Automation and DevOps, Associate (JNCIA-DevOps) Pdf Pass Guaranteed Quiz

There is nothing more exciting than an effective and useful JN0-224 question bank if you want to get the JN0-224 certification in the least time by the first attempt. The sooner you use our JN0-224training materials, the more chance you will pass JN0-224 the exam, and the earlier you get your JN0-224 certificate. You definitely have to have a try on our JN0-224 exam questions and you will be satisfied without doubt. Besides that, We are amply praised by our customers all over the world not only for our valid and accurate JN0-224 study materials, but also for our excellent service.

Juniper Automation and DevOps, Associate (JNCIA-DevOps) Sample Questions (Q13-Q18):

NEW QUESTION # 13
Which Python operator is used to test if two variables are equal?

- A. %
- B. ==
- C. =
- D. !=

Answer: B

Explanation:
In Python, the == operator is used to test whether two variables are equal. It returns True if the variables are equal and False if they

are not.
Option B (==) is correct because it is the equality operator in Python.
Option A (!=) is used for inequality, Option C (%) is the modulus operator, and Option D (=) is used for assignment, not for testing equality.
Supporting Reference:
Python Documentation on Operators: The official Python documentation covers the use of == for equality checks.

NEW QUESTION # 14
Which two statements about the REST API are correct? (Choose two.)

- A. The REST API application is stateless.
- B. The TCP session state is maintained by the server.
- C. The REST API application is stateful.
- D. The TCP session state is maintained by the client

Answer: A,D

Explanation:
REST (Representational State Transfer) is an architectural style for designing networked applications, and its key principles include:
Statelessness (B): Each request from the client to the server must contain all the information needed to understand and process the request. The server does not store any session state between requests, meaning each request is independent and does not rely on previous ones.
TCP Session State (C): While REST itself is stateless, the underlying TCP connection's state, such as keeping the connection alive or managing retries, is handled by the client. The server does not retain information about the TCP connection beyond the processing of the individual request.
Options A and D are incorrect because they imply that the REST API is stateful, which contradicts the stateless nature of REST.
Reference:
REST API Design Principles: Describes the stateless nature of REST and the responsibility of clients in managing session state.
Web Development Documentation: Discusses how REST APIs operate, focusing on statelessness and client-server interaction.

NEW QUESTION # 15
You are asked to write an on-box script that will be triggered when a specific interface on a Junos device goes down.
Which type of on-box script should you use to accomplish this task?

- A. operation
- B. event
- C. SNMP
- D. commit

Answer: B

Explanation:
An event script is used to automate responses to system events in Junos, such as an interface going down. These scripts are triggered automatically when a specified event occurs, making them suitable for tasks like monitoring interface status and executing actions when the status changes.
Option B (event) is correct because event scripts are designed for reacting to system events like an interface going down.
Option A (commit) is used for configuration changes, Option C (operation) is used for operational tasks, and Option D (SNMP) is not applicable in this context.
Supporting Reference:
Juniper Networks Event Scripts Documentation: Details how event scripts are used to automate responses to specific system events in Junos

NEW QUESTION # 16
Which two statements about Junos automation are correct? (Choose two.)

- A. The Junos REST API client is off-box.
- B. Junos automation allows for device provisioning through the console port.

- C. Junos automation does not allow for device provisioning throuqh the console port.
- D. The Junos REST API client is on-box.

Answer: B,D

NEW QUESTION # 17
Which Junos configuration database is updated by PyEZ by default?

- A. private
- B. ephemeral
- C. dynamic
- D. shared

Answer: A

Explanation:
An event script is used to automate responses to system events in Junos, such as an interface going down. These scripts are triggered automatically when a specified event occurs, making them suitable for tasks like monitoring interface status and executing actions when the status changes.
Option B (event) is correct because event scripts are designed for reacting to system events like an interface going down.
Option A (commit) is used for configuration changes, Option C (operation) is used for operational tasks, and Option D (SNMP) is not applicable in this context.
Supporting Reference:
Juniper Networks Event Scripts Documentation: Details how event scripts are used to automate responses to specific system events in Junos

NEW QUESTION # 18
