## Use MB-820 Practice Exam Software For Self Evaluation

Our exam prep material is famous among MB-820 exam candidates which help to polish the knowledge required to pass the Microsoft MB-820 exam. The certification is organized by MB-820 internationally. Our Microsoft MB-820 exam questions are the most cost-effective as we understand that you need low-cost material but are authentic and updated. Test4Sure provides its Microsoft MB-820 Exam Questions in three forms, one is PDF eBook, the second is practice exam software for Windows-based systems, and the third is an online practice test.

## Microsoft Dynamics 365 Business Central Developer Sample Questions (Q75-Q80):

### NEW QUESTION # 75

You plan to create a table to hold client data.

You have the following data integrity requirements:

- \* Lookups into other records must be established.
- \* Validate if a record exists in a destination record.

You need to select the table field property to use for each requirement.

Which table field property should you use? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

**Answer:**

Explanation:

Explanation:

For the data integrity requirements, the table field properties to use are:

- \* To establish lookups into other records, use the TableRelation property.
- \* To validate if a record exists in a destination record, use the ValidateTableRelation property.

In Business Central, when creating tables to hold data, maintaining data integrity is crucial:

\* TableRelation Property: This property is used to create a relationship between the field in one table and a field in another table, which is typically used for lookups. When you set the TableRelation property on a field, it allows users to select from a list of values that exist in the related table.

\* ValidateTableRelation Property: This property is used to ensure that the value entered in a field matches one of the values in a related table. If a user tries to enter a value that doesn't exist in the related table, an error will occur.

### NEW QUESTION # 76

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question set might have more than one correct solution, while others might not have a correct solution.

After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear on the review screen.

A company creates a Business Central app and a table named MyTable to store records when sales orders are posted.

Users report the following issues:

- \* The users receive permission errors related to MyTable.
- \* Users are no longer able to post sales orders since installing the new app.
- \* The users cannot access the list page created in MyTable.

You need to resolve the user issues without creating new permission sets. You must use the principle of least privilege.

Solution: Decorate the event subscriber used for inserting data in MyTable by entering

(InherentPermissions(PermissionObjectType::TableData, Database::MyTable, 'R')) Does the solution meet the goal?

- A. Yes
- B. No

**Answer: A**

Explanation:

Using InherentPermissions in an event subscriber with the specified syntax could potentially resolve the permission issues related to MyTable, provided that the permissions specified (in this case, 'R' for Read) align with the minimum necessary for the users to perform their tasks. This approach allows the app to grant permissions dynamically based on the context of the event subscriber, which in this case is involved with inserting data into MyTable. By granting Read permission at the event level, it ensures that users have the necessary permissions to interact with MyTable in the context of the operations facilitated by the event subscriber, without needing to alter existing permission sets or grant broader permissions than necessary. This solution adheres to the principle of least privilege by ensuring that permissions are granted only within the narrow scope needed for specific operations, thereby potentially resolving the reported user issues in a secure and controlled manner.

### NEW QUESTION # 77

You need to create the Install codeunit that is required in the extension used for installing or updating the Housekeeping app.

Which data type or declaration should you use? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

**Answer:**

Explanation:

□ Explanation:

For the Install codeunit required for the extension used for installing or updating the Housekeeping app, you should use the following data type and declaration:

- \* Data type for information: ModuleInfo

- \* Start of the declaration of the method or procedure to perform the tasks: local procedure In AL language, which is used for developing extensions in Business Central, an Install codeunit is a special type of codeunit that is used to handle installation or upgrade logic for an extension.

- \* ModuleInfo is a data type that contains information about the current extension, such as its version. It is typically used within the OnInstallAppPerCompany or OnUpgradePerCompany triggers of an Install codeunit to determine if the app is being installed for the first time or upgraded.

- \* A local procedure within an Install codeunit is a method that is only accessible within the codeunit itself. It is not visible to other objects or extensions. This is suitable for tasks that are internal to the installation process and should not be exposed globally. These selections align with the requirements of handling installation and update procedures in a controlled and encapsulated manner within Business Central extensions.

**NEW QUESTION # 78**

You need to create the Install codeunit that is required in the extension used for installing or updating the Housekeeping app.

Which data type or declaration should you use? To answer, select the appropriate options in the answer area.

NOTE; Each correct selection is worth one point.

□

**Answer:**

Explanation:

□ Explanation:

For the Install codeunit required for the extension used for installing or updating the Housekeeping app, you should use the following data type and declaration:

- \* Data type for information: ModuleInfo

- \* Start of the declaration of the method or procedure to perform the tasks: local procedure In AL language, which is used for developing extensions in Business Central, an Install codeunit is a special type of codeunit that is used to handle installation or upgrade logic for an extension.

- \* ModuleInfo is a data type that contains information about the current extension, such as its version. It is typically used within the OnInstallAppPerCompany or OnUpgradePerCompany triggers of an Install codeunit to determine if the app is being installed for the first time or upgraded.

- \* A local procedure within an Install codeunit is a method that is only accessible within the codeunit itself. It is not visible to other objects or extensions. This is suitable for tasks that are internal to the installation process and should not be exposed globally. These selections align with the requirements of handling installation and update procedures in a controlled and encapsulated manner within Business Central extensions.

Topic 1, Case Study Alpine Ski House

Alpine Ski House is a company that owns and operates hotels, restaurants, and stores. Currently, the company uses the following software and interlace:

- \* Property management software (PMS) to manage hotel rooms

- \* On-premises accounting software to generate sales invoices and create purchase orders

- \* An API that allows restaurants and stores to obtain necessary information Restaurants and stores use standalone software for point of sale (POS) devices. Each day, the POS terminals generate a text file of sales data and save the files in a serval folder. An account assistant must manually import the files to the current software tables to be processed by the system.

The general manager receives several reports monthly from department managers. The reports take too much time to prepare.

The company is moving from a different system to Business Central online to manage the whole company.

The company plans to increase efficiency in every department by using APIs to obtain or share information between the different systems.

Each department involved in purchasing must be able to make purchase requests automatically and easily.

The departments do not need access to the full ERP management system.

Alpine Ski House requires the development of several extensions for the planned improvements. Business Central design patterns must be used to develop all extensions.

Alpine Ski House must develop the following pages:

- \* Pages that provide multiple configurations in a multistep dialog, like a wizard, to provide required information when the extensions are first installed

\* Department-specific Role Center pages to show relevant information and pages with additional information The IT department plans to use Power BI to analyze departmental information. The database must be configured to provide optimal performance. The housekeeping department requires the following to increase efficiency and help avoid data entry errors:

\* A Housekeeping Role Center to minimize navigation to relevant areas In Business Central online and to show relevant information in it

\* Pages to embed into a new Room page to show additional information about the Room entity

\* A table named Room Incident for the housekeeping team to enter room issue information

\* A Housekeeping canvas app that connects to an extension

The department requires the development of an extension with a new API page named RoomsAPI.

\* The housekeeping team will use RoomsAPI to publish room details, update when work is complete, or provide repair notifications from the canvas app.

\* This custom API page must expose a custom table named Rooms and have an ID 50000. The table must be able to update from the PMS. The PMS team must know the end to connect to the custom API.

\* A developer provides the following details for the API page:

APIPublisher = 'alpine';

APIGroup = 'integration';

APIVersion = 'v2.6';

entityName = 'room';

EntitySetName = 'rooms';

\* The extension must be published in Business Central online and include a list page named Room List that includes all hotel rooms.

\* Installation or updates to this extension must meet the following requirements:

o Some web services must be published automatically.

o The version of the specified application's metadata must be obtained in AL language.

o The code required to perform tasks cannot be accessible from other parts of the application.

The Room Incident table information must include the following fields:

\* Incident entry: An incremental number

\* Room No.: A room from the Room table

\* Incident Date: The work date

o The table definition in the Room Incident table must autofill the Incident Date when the housekeeping team inserts a new record, o The value for Incident Date must be the work date configured in the Business Central online client.

\* Status: Includes the following options to identify the status of the incident:

o Open: When the Room Incident is created

o In Progress: When someone starts repair work

o Closed: When the incident is solved

\* Incident Closing Date: Auto-updating field (when the status passes to Closed, the field will update with the work date)

\* Incident Description: Text

\* Image. Media data type

o The stored picture must be downloadable from a menu action.

o A Room Incident page must be developed to contain the download action.

To increase efficiency, the new system must manage the generated data from the restaurants and stores directly by using the API on the POS terminals.

\* The company requires a code unit called from a job queue to read the information from the POS terminal APIs.

\* The POS terminal information must be stored in a table named POS Information, have an ID 50100. and be editable on a page.

\* The account manager requires an option on the menu of the page to run the process manually.

To analyze the information received from the POS terminals, the company requires:

\* A custom API named ticketAPI to export the information to Power BI

\* Use of the Read Scale-Out feature to improve database performance

The purchasing department requires a new entity in Business Central online to log non-conformities of goods received from vendors. The entity must be set up as follows:

\* The non-conformity entity must have two tables:

o a header with common information

o one or more lines with the detailed received items that are non-conforming

\* The entity requires a page named Non-conformity and a subpage named Non-Conformity Lines to store the information.

When a purchase order with incorrect quantity or quality issues is received, the entity must create a non-conformity document in the system. The following information must be in the document:

\* Non-conformity Number: must use the No. Series table from Business Central online to manage this field and use these features:

o Alphanumeric values

o Number format that includes "NO and the year as part of the number: for example, NC24-001

\* Non-conformity Date: stores only the creation date

\* Vendor No.: stores the number of the vendor that sent the items; only vendors from the company must be included

\* Owner: code of an employee defined in the company

\* Receipt No.: must meet the following conditions:

- o Be an existing receipt No.
- o Be received from the vendor indicated in the Vendor No. field

\* Comments: can include comments with rich text and pictures to illustrate quality problems

\* Status: includes nonconformity statuses, such as:

- o Open
- o Notified
- o Closed

\* Lines must contain the following details:

- o Item No.: item received (for existing inventory items only)
- o Description: item description
- o Quantity: non-conforming quantity
- o Non-conformity Type:
  - # Quality
  - # Quantity
  - # Delivery date

The serial numbers of the non-conformities and the period in which they can be created must be in a configuration table and its corresponding page to allow them to be modified for the users.

### NEW QUESTION # 79

You need to define the properties of the comments field of the Non-conformity page.

How should you complete the code segment? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

☐

**Answer:**

Explanation:

☐ Explanation:

☐

### NEW QUESTION # 80

.....

As you know, getting a MB-820 certificate is helpful to your career development. At the same time, investing money on improving yourself is sensible. You need to be responsible for your life. Stop wasting your time on meaningless things. We sincerely hope that you can choose our MB-820 Study Guide, which may change your life and career by just a step with according MB-820 certification. For we have helped so many customers achieve their dreams.
