Oracle 1Z0-1072-25 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">• Compute: This section measures skills of cloud architects responsible for designing scalable and resilient infrastructure, covering compute instance configuration, autoscaling policies, and OS management. It evaluates understanding of OCI compute image options, infrastructure maintenance processes, and strategies for optimizing instance performance across availability domains.
Topic 2	<ul style="list-style-type: none">• Storage: Designed for storage administrators managing enterprise data solutions, this section tests proficiency in deploying Block• File• Object Storage with lifecycle management, cross-region replication, and tiered storage strategies. It includes configuring volume groups, snapshots, versioning, and security controls while analyzing storage performance metrics and cost optimization techniques.

Topic 3	<ul style="list-style-type: none"> • Networking: Targeting network architects designing secure cloud architectures, this domain focuses on Virtual Cloud Network (VCN) implementation, including subnet design, IP address management, and routing through gateways (NAT, service, internet). It assesses expertise in VPN • FastConnect deployment, DNS configuration, load balancer setup, and advanced tools like Network Path Analyzer for troubleshooting latency or connectivity issues.
Topic 4	<ul style="list-style-type: none"> • Identity and Access Management (IAM): This domain validates skills of security architects implementing granular access controls, emphasizing IAM policy creation, compartment organization, and dynamic group configuration. It covers identity domain management, network source restrictions, and tag-based access mechanisms to enforce least-privilege principles across OCI resources

Oracle Cloud Infrastructure 2025 Architect Associate Sample Questions (Q22-Q27):

NEW QUESTION # 22

Why was SSH still possible after port 22 was removed from the Security Lists?

- A. The VCN where that compute instance resides still has an Internet Gateway.
- **B. The VNIC of that compute instance is attached to a Network Security Group (NSG).**
- C. The VNIC of that compute instance is attached to a Cluster Network.
- D. The VCN where that compute instance resides still has a route rule.

Answer: B

Explanation:

Even after removing port 22 from the Security Lists, SSH was still possible because the Virtual Network Interface Card (VNIC) of the compute instance is attached to a Network Security Group (NSG).

NSGs: NSGs provide a more flexible and granular way to manage security rules compared to Security Lists. They allow you to apply security rules directly to VNICs associated with resources such as compute instances. If an NSG allows traffic on port 22, SSH will still be possible, regardless of the Security List settings.

NEW QUESTION # 23

Which IAM Identity Domain type should you create for a full-featured Identity-as-a-Service (IDaaS) solution?

- A. External User
- **B. Premium**
- C. Oracle Apps Premium
- D. Free

Answer: B

Explanation:

In Oracle Cloud Infrastructure (OCI), when you need a full-featured Identity-as-a-Service (IDaaS) solution, the appropriate Identity Domain type to create is Premium.

Premium Identity Domain: This option provides a comprehensive set of identity and access management (IAM) capabilities, including advanced security features, identity governance, and support for enterprise-grade integrations. It supports managing user identities, multifactor authentication, and various other identity services required for a robust IDaaS solution.

Other Options:

External User: This is a limited domain type typically used for managing users who only need access to specific external services.

Free: This domain type offers limited features and is not intended for full-featured enterprise IAM requirements.

Oracle Apps Premium: This is tailored for integrating with Oracle applications but does not offer the broad capabilities of the Premium option.

NEW QUESTION # 24

Which TWO statements are NOT correct regarding the Oracle Cloud Infrastructure (OCI) burstable instances?

- A. Burstable instances cost less than regular instances.
- B. Baseline utilization is a fraction of each CPU core.
- C. If the instance's average CPU utilization is below the baseline, it can burst above the baseline.
- D. Burstable instances are charged according to the baseline OCPU.

Answer: A,D

Explanation:

The following statements about OCI burstable instances are NOT correct:

A . Burstable instances cost less than regular instances: This is incorrect because burstable instances are not necessarily cheaper; the cost depends on the baseline utilization. While they allow for cost efficiency when running at a lower CPU baseline, they can become more expensive if frequently bursting above the baseline.

B . Burstable instances are charged according to the baseline OCPU: This is incorrect because burstable instances are billed based on actual OCPU usage, which includes both baseline and burst usage. If an instance frequently operates above its baseline, the cost will reflect this higher usage.

Correct Concepts:

C . Burstable instances can temporarily use more CPU than their baseline if the average CPU utilization is below the baseline.

D . Baseline utilization is a fraction of each CPU core, which determines the level of consistent performance available without bursting.

NEW QUESTION # 25

How can OCI IAM be configured to facilitate cross-region access?

- A. The identity domain automatically replicates to the other region.
- B. Identity domain replication must be enabled.
- C. Users can access resources in all regions by default.
- D. The administrator can grant users permissions to access specific resources in the other region.

Answer: D

Explanation:

In Oracle Cloud Infrastructure (OCI), cross-region access is facilitated by configuring IAM policies that grant users or groups permissions to access resources in other regions. IAM policies in OCI are global, meaning they apply across all regions by default. However, an administrator can specifically configure these policies to allow or restrict access to resources in different regions.

Example: An administrator can write a policy that allows a user to manage compute instances in a specific region by including the region's name in the policy statement.

NEW QUESTION # 26

Which statement is NOT correct regarding the Oracle Cloud Infrastructure (OCI) File System snapshots?

- A. Before you can clone a file system, at least one snapshot must exist for the file system.
- B. Snapshots are a consistent, point-in-time view of your file systems.
- C. Even if nothing has changed within the file system since the last snapshot was taken, a new snapshot consumes more storage.
- D. Snapshots are accessible under the root directory of the file system at .snapshot/name.

Answer: C

Explanation:

In OCI File Storage, snapshots are point-in-time, read-only copies of a file system that do not immediately consume additional storage beyond the space needed to track changes.

Incorrect Statement: The statement that a new snapshot consumes more storage even if nothing has changed is incorrect. Snapshots are space-efficient; they only consume additional storage as changes are made to the file system after the snapshot is taken. If no changes are made between snapshots, the storage consumption remains minimal.

Correct Statements:

- B . Before cloning a file system, at least one snapshot must exist, as the clone operation relies on this snapshot to create a copy.
- C . Snapshots are accessible under the .snapshot directory, allowing users to view and restore files from specific snapshots.
- D . Snapshots provide a consistent, point-in-time view of the file system, ensuring data integrity.
