Tableau Server Certified Associate Exam Sample Questions (Q215-Q220):

NEW QUESTION # 215

You attempt to delete a user who owns content on a Tableau Server. What is the result of the delete action?

- A. The user is deleted, and the user's content is reassigned to the project leader
- B. The user and all of the user's content is deleted
- C. The user is deleted, and the user's content is reassigned to the server administrator
- D. The user is switched to an Unlicensed site role and is NOT deleted

Answer: D

Explanation:

Deleting a user in Tableau Server involves handling their owned content (workbooks, data sources)-let's analyze the process:

- * Deletion Rules:
- * Ownership Check: Tableau prevents deletion if the user owns content to avoid orphaning it.
- * Action: Instead of deleting, the user's site role is set to Unlicensed, retaining their account and content ownership.
- * Resolution: An admin must reassign ownership (e.g., via Users > Actions > Change Owner) before deletion.
- * Option D (User switched to Unlicensed and NOT deleted): Correct.
- * Details: Attempting deletion (e.g., Users > Select User > Actions > Delete) triggers a check. If content exists, the user becomes Unlicensed-still in the system but unable to log in.
- * Why: Protects data integrity-content remains accessible for reassignment.
- * Option A (Deleted, content to server admin): Incorrect.
- * Why: No automatic reassignment to the server admin-manual action is required first.
- * Option B (Deleted, content to project leader): Incorrect.
- * Why: Project leaders don't automatically inherit content-no such mechanism exists.
- * Option C (User and content deleted): Incorrect.
- * Why: Tableau avoids deleting content with the user-too destructive without explicit intent.

Why This Matters: This safeguard prevents accidental data loss, ensuring admins manage ownership transitions deliberately.

NEW QUESTION # 216

Which two settings should you configure to allow users to post comments on a visualization? (Choose two.)

- A. Comments must be enabled on the site Settings page
- B. Comments must be enabled on the server Settings page
- C. The relevant users must have a minimum site role of Explorer (can publish)
- D. Add Comments must be allowed in permissions for the relevant users

Answer: A,D

Explanation:

Comments on visualizations foster collaboration in Tableau Server-let's break down the requirements:

- * Commenting Prerequisites:
- * Site-Level Enablement: Comments must be activated for the site.
- * Permission: Users need the "Add Comment" capability on the content.
- * Site Role: Minimum role of Viewer allows commenting if permissions are set.
- * Option B (Add Comments must be allowed in permissions): Correct.
- * Details: In the Permissions dialog (e.g., for a workbook), set "Add Comment" to "Allowed" for users/groups. Default is "Denied" unless explicitly enabled.
- * How: Content > Workbooks > Actions > Permissions > Edit Rule.
- * Why: Permissions are granular-site enablement alone isn't enough.
- * Option D (Comments must be enabled on the site Settings page): Correct.
- * Details: Go to Site > Settings > General > Allow Comments-check the box.
- * Why: This is a site-wide toggle (default: off). Without it, no one can comment, regardless of permissions.
- * Option A (Minimum site role of Explorer - can publish): Incorrect.
- * Why: Viewer role suffices if permissions allow-Explorer (can publish) isn't required (it adds publishing, not commenting).
- * Option C (Server Settings page): Incorrect.
- * Why: Comments are a site-level feature, not server-wide-no such toggle exists in TSM's Server Settings.

Why This Matters: Enabling comments at both site and content levels ensures controlled collaboration-key for team insights.

NEW QUESTION # 218

What Tableau Server authentication method should you configure to use OpenID Connect?

- A. Local Authentication
- B. Kerberos
- **C. SAML**
- D. Active Directory

Answer: C

Explanation:

Tableau Server supports multiple authentication methods, including Local Authentication, Active Directory, Kerberos, SAML, and OpenID Connect. OpenID Connect (OIDC) is an identity layer built on OAuth 2.0, commonly used for single sign-on (SSO). In Tableau Server, OIDC is implemented as a variant of SAML (Security Assertion Markup Language) authentication because both are SSO protocols managed through the same configuration workflow.

To use OpenID Connect:

* Configure Tableau Server for SAML/SSO.

* Provide an OIDC-compatible identity provider (IdP) configuration (e.g., Google, Okta).

* Set up the IdP metadata and certificates in TSM.

* Option D (SAML): Correct. Tableau Server treats OIDC as a subset of its SAML authentication framework, so you configure it under the SAML settings in TSM.

* Option A (Local Authentication): Incorrect. Local Authentication uses Tableau's internal user database, not an external SSO protocol like OIDC.

* Option B (Kerberos): Incorrect. Kerberos is a network authentication protocol for Windows environments, unrelated to OIDC.

* Option C (Active Directory): Incorrect. AD uses LDAP or Kerberos, not OIDC, for authentication.
