Brilliantly Updated ISQI CTFL-AT Exam Dumps

The most important thing for preparing the CTFL-AT exam is reviewing the essential point. Some students learn all the knowledge of the test. They still fail because they just remember the less important point. In order to service the candidates better, we have issued the CTFL-AT test engine for you. Our company has accumulated so much experience about the test. So we can predict the real test precisely. Almost half questions and answers of the real exam occur on our CTFL-AT practice material. That means if you study our study guide, your passing rate is much higher than other candidates. Preparing the CTFL-AT exam has shortcut. From now, stop learning by yourself and try our test engine. All your efforts will pay off one day.

The CTFL-AT Exam is an extension of the ISTQB Foundation Level certification program. CTFL-AT exam is designed to provide a comprehensive understanding of Agile testing concepts, including Agile software development process, testing in Agile projects, testing techniques, and tools. ISTQB Certified Tester - Foundation Level Extension - Agile Tester certification program is designed to help professionals gain a competitive edge in their career by showcasing their expertise in Agile testing methodologies.

ISQI ISTQB Certified Tester - Foundation Level Extension - Agile Tester Sample Questions (Q68-Q73):

NEW QUESTION # 68

You are working in a software development company which, for many years, used a sequential development model and was organized into separate departments for each functional group (e.g. business analysts, developers, testers) located within their own office space. Your organization has recently changed to a SCRUM agile framework. Which of the following is an important

organizational and behavioral best practice for a tester in the SCRUM team that should have also been practiced when using the sequential model?

- A. Resilient testing means that the testing process is capable of dealing with rapid changes throughout the development process with test plans being updated during each iteration.
- B. Credibility means that the tester must share information with the stakeholders about the test process so that they find the selected test strategy and testing activities trustworthy.
- C. Co-located teamwork means that all team members, including developers and testers, must sit together in the same office, so they can quickly communicate face-to-face.
- D. **Cross-functional teamwork means that all team members contribute to testing in various ways. For example, involving people with the test strategy, test planning and execution as well as test reporting.**

Answer: D

Explanation:

Cross-functional teamwork is an important organizational and behavioral best practice for a tester in the SCRUM team that should have also been practiced when using the sequential model. Cross-functional teamwork means that all team members, regardless of their functional roles, collaborate and share their skills and knowledge to achieve a common goal. In the context of testing, this means that testing is not seen as a separate activity or phase, but as an integral part of the development process. All team members contribute to testing in various ways, such as:

- * Involving people with the test strategy, test planning and execution as well as test reporting. This can help ensure that the testing activities are aligned with the business objectives, the user needs, and the technical requirements. It can also help improve the test coverage, the test quality, and the test efficiency.
- * Sharing the responsibility for testing among the team members. This can help reduce the workload and the dependency on a single tester or a testing team. It can also help increase the feedback and the communication among the team members, and foster a culture of quality and learning.
- * Leveraging the diverse skills and perspectives of the team members. This can help enhance the test design and the test execution by applying different techniques, tools, and approaches. It can also help identify and address the risks, the issues, and the opportunities for improvement from various angles. References: ISTQB Foundation Level Agile Tester Syllabus1, Section 1.2.1, page 9; ISTQB Glossary of Testing Terms2, version 4.0, page 16.

NEW QUESTION # 69

In Agile projects, which of the following approaches would result in the best compromise for preserving independence of testers and for allowing testers to have a good understanding of the product as well as good relationships with other team members?

- A. Having independent separate test teams where all of the testers work separately from developers without being assigned to Agile teams
- B. Having independent separate test teams where testers are assigned to Agile teams on-demand during the final days of each iteration
- C. **Having independent separate test teams where testers are assigned to Agile teams on a long-term basis, at the beginning of an Agile project**
- D. Having only Agile teams where testers are integral parts and where they perform many of the testing tasks, without having an independent test team

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

FromCTFL-AT Syllabus v4.0, Section 2.5 Testers and Independence, it states:

"Testers may be assigned to Agile teams on a permanent or rotating basis. While full independence is compromised, this setup allows for better collaboration and understanding of the product, while still maintaining some degree of independence." Thus, Option B is the most accurate -long-term embedded testers support Agile collaboration while preserving partial independence.

* Option A leads to late involvement, which contradicts Agile principles.

* Option C sacrifices independence entirely.

* Option D is traditional and contrary to Agile values of collaboration.

Learning Objective (K2) - Understand approaches to preserving test independence in Agile

NEW QUESTION # 70

Which of the following is NOT a typical task performed by the tester within an Agile team?

- A. Ensuring all project status meetings are held according to the plan.
- B. Ensuring the appropriate testing tasks are scheduled during iteration planning.
- C. Suggesting improvements in team retrospectives.
- D. Working with business stakeholders to clarify requirements.

Answer: A

Explanation:

The tester within an Agile team is not responsible for ensuring all project status meetings are held according to the plan. This is typically a task for the Scrum Master, who facilitates the meetings and ensures that the team follows the Agile principles and practices. The tester within an Agile team is responsible for ensuring the appropriate testing tasks are scheduled during iteration planning, suggesting improvements in team retrospectives, and working with business stakeholders to clarify requirements. These are all tasks that contribute to the quality of the software and the testing process, as well as the collaboration and communication within the team and with the customers. References: ISTQB Foundation Level Agile Tester Syllabus, Section 2.3.1, page 171; ISTQB Foundation Level Agile Tester Sample Exam Questions, Question 2.3.1-1, page 82

NEW QUESTION # 71

Which of the following tools would you expect to be the most useful to report defects found during exploratory testing sessions in Agile projects?

- A. Continuous integration and build distribution tools
- B. Application lifecycle management (ALM) and task management tools
- C. Tools that capture and log activities performed on an application during its use
- D. Tools that generate data to populate an application's database

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

From CTFL-AT Syllabus v4.0, Section 3.1 Exploratory Testing:

"Exploratory testing benefits from tools that record tester activity, allowing the tester to reproduce and document issues found during unscripted testing sessions." Option D is correct - activity capture tools help testers log, replay, and report findings effectively in exploratory sessions.

- * Option A is for test data preparation, not reporting.
- * Option B is related to integration, not exploratory testing.
- * Option C helps track tasks but lacks session capture features.

Learning Objective (K2) - Use appropriate tools during exploratory testing

NEW QUESTION # 72

Which tasks are typically performed by a tester on an Agile project?

- 1) Implementing test strategy.
- 2) Documenting business requirements.
- 3) Measuring and reporting test coverage.
- 4) Coaching development team in relevant aspects of testing.
- 5) Executing test-driven development tests.

- A. 1, 3, 4
- B. 2, 4, 5
- C. 1, 3
- D. 2, 5

Answer: A

Explanation:

Explanation

A tester on an Agile project typically performs the following tasks12:

Implementing test strategy: A tester helps to define and implement the test strategy for the Agile project, which includes the test approach, test levels, test types, test techniques, test tools, test environment, test data, test metrics, and test documentation.

Measuring and reporting test coverage: A tester measures and reports the test coverage of the product features and quality attributes, such as functionality, usability, performance, security, etc. Test coverage can be expressed in terms of test cases, test scenarios, test sessions, test conditions, test data, code, etc.

Coaching development team in relevant aspects of testing: A tester coaches the development team in relevant aspects of testing, such as test design, test execution, test automation, test-driven development, behavior-driven development, exploratory testing, etc. A tester also helps the development team to improve their testing skills and practices.

The following tasks are not typically performed by a tester on an Agile project:

Documenting business requirements: Business requirements are usually documented by the product owner or the business analyst, not by the tester. The tester may review and provide feedback on the business requirements, but the tester is not responsible for documenting them.

Executing test-driven development tests: Test-driven development tests are usually executed by the developers, not by the tester. The tester may assist the developers in creating and reviewing the test-driven development tests, but the tester is not responsible for executing them.

Therefore, the correct answer is C, as it contains the tasks that are typically performed by a tester on an Agile project. References: ISTQB Foundation Level Agile Tester Extension Syllabus1, pages 14-15, 18-19, 22-23; ISTQB Agile Tester Sample Exam2, question 17.

NEW QUESTION # 73

.....

It is universally acknowledged that the pass rate is the most persuasive evidence to prove how useful and effective a kind of CTFL-AT practice test is. In terms of our training materials, the pass rate is one of the aspects that we take so much pride in because according to the statistics from the feedbacks of all of our customers, under the guidance of our CTFL-AT Preparation materials the pass rate among our customers has reached as high as 98% to 100%, which marks the highest pass rate in the field. Just feel rest assured to buy our CTFL-AT study guide, which definitely will be the best choice for you.
