WGU Cloud Deployment and Operations Sample Questions (Q62-Q67):

NEW QUESTION # 62

(What needs to be configured in Systems Manager to run Automation documents on schedule?)

- A. Session preferences
- B. Rate control
- **C. Maintenance window**
- D. Resource groups

Answer: C

Explanation:

To run Automation documents on a schedule in AWS Systems Manager, a maintenance window must be configured. Maintenance windows define the time periods during which automated tasks, including the execution of Automation documents, can run. The WGU Cloud Deployment and Operations Study Guide (Section 5.2, Maintenance Windows) explains that maintenance windows are used to schedule and control the execution of Systems Manager tasks, ensuring they align with operational windows. Rate control, session preferences, and resource groups are not used for scheduling automation tasks.

NEW QUESTION # 63

(What can AWS Config directly invoke to cause remediation of findings?)

- A. Control Tower guardrail
- B. CloudWatch alarm
- **C. Lambda function**
- D. Systems Manager document

Answer: C

Explanation:

AWS Config can directly invoke an AWS Lambda function to cause remediation of findings by triggering automated responses to configuration changes or non-compliant resources. This integration enables real-time corrective actions. The WGU Cloud Deployment and Operations Study Guide (Section 6.1, AWS Config) states, "AWS Config can invoke a Lambda function as a remediation action, allowing automated fixes for non-compliant resources (e.g., terminating unauthorized instances)." Control Tower guardrails, CloudWatch alarms, and Systems Manager documents are not directly invoked by Config for this purpose.

NEW QUESTION # 64

(Which solution sends DNS queries to separate AWS compute instances?)

- A. Amazon EC2 Auto Scaling
- **B. Amazon Route 53**
- C. Amazon CloudWatch
- D. AWS Elastic Beanstalk

Answer: B

Explanation:

Amazon Route 53 is the AWS solution that sends DNS queries to separate AWS compute instances by leveraging routing policies to distribute traffic across multiple resources. It acts as a scalable Domain Name System (DNS) service, directing queries to healthy instances based on configurations like latency or weighted routing. The WGU Cloud Deployment and Operations Study Guide (Section 3.1, Route 53) states, "Route 53 uses DNS to route end-user requests to multiple AWS compute instances, supporting features like health checks and traffic distribution." Elastic Beanstalk, CloudWatch, and EC2 Auto Scaling do not perform DNS query routing.

NEW QUESTION # 65

(Which type of support plan provides a technical account manager and full use of Trusted Advisor?)

- A. Business
- B. Standard
- **C. Enterprise**

- D. Developer

Answer: C

Explanation:

The Enterprise support plan provides a technical account manager (TAM) and full use of Trusted Advisor, offering proactive guidance and comprehensive access to all checks. This plan is designed for large-scale, mission-critical workloads. The WGU Cloud Deployment and Operations Study Guide (Section 6.4, AWS Support Plans) states, "The Enterprise support plan includes a dedicated Technical Account Manager and full Trusted Advisor access, providing 24/7 support and proactive optimization recommendations." Developer, Standard, and Business plans offer limited or no TAM support and partial Trusted Advisor access.

NEW QUESTION # 66

(An administrator deploys an EC2 instance with the public IP address 54.18.127.233 into a newly created VPC in us-west-2. The EC2 instance must be accessible via ec2-public-54.18.127.233.us-west-2.compute.amazonaws.com from the internet. Which solution should be used?)

- A. Set the VPC attribute enableDnsSupport to false
- **B. Set the VPC attribute enableDnsHostnames to true**
- C. Assign a resource-based name to the EC2 instance
- D. Assign a resource tag to the EC2 instance

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To make the EC2 instance accessible via a public DNS hostname like ec2-public-54.18.127.233.us-west-2.

compute.amazonaws.com, the administrator must set the VPC attribute enableDnsHostnames to true. This enables the automatic assignment of public DNS hostnames to instances with public IP addresses in the VPC.

The WGU Cloud Deployment and Operations Study Guide (Section 3.2, VPC Configuration) states, "Setting enableDnsHostnames to true in the VPC configuration ensures that EC2 instances with public IPs receive a public DNS hostname (e.g., ec2-public-`<ip>`.`<region>`.compute.amazonaws.com), facilitating internet accessibility." Resource tags, disabling DNS support, and resource-based names do not enable this functionality.`</region></ip>`
