SAP C-CPI-2506 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Managing APIs: This section of the exam measures the skills of Solution Architects and focuses on managing APIs within the SAP ecosystem. It covers topics such as API provisioning, lifecycle management, security policies, and monitoring, ensuring candidates can handle APIs effectively for enterprise integration needs.
Topic 2	<ul style="list-style-type: none">SAP Event Mesh: This section of the exam measures the skills of Solution Architects and centers on using SAP Event Mesh to support event-driven integration. It highlights the importance of asynchronous communication, event publishing, and subscription models, allowing organizations to build scalable and decoupled systems.

Topic 3	<ul style="list-style-type: none"> • SAP Integration Suite Overview: This section of the exam measures the skills of Integration Consultants and covers the foundational concepts of the SAP Integration Suite. It provides an understanding of the suite's capabilities, its role in connecting applications, and its relevance in modern cloud-based integration scenarios.
Topic 4	<ul style="list-style-type: none"> • Implementing Cloud Integration: This section of the exam measures the skills of Integration Consultants and examines how cloud integration flows are designed and deployed. It emphasizes creating integration scenarios, handling connectivity, and applying best practices to build efficient, secure, and reliable integration processes in SAP's cloud environment.

SAP Certified Associate - Integration Developer Sample Questions (Q18-Q23):

NEW QUESTION # 18

Which of the following capabilities within SAP Integration Suite are core for integration? Note: There are 3 correct answers to this question.

- **A. Integration Assessment**
- B. Open Connectors
- **C. API Management**
- D. Integration Advisor
- **E. Cloud Integration**

Answer: A,C,E

Explanation:

The following capabilities within SAP Integration Suite are core for integration: Integration Assessment, Cloud Integration, and API Management. Integration Assessment allows you to evaluate your integration landscape and strategy and identify the best-fit integration technologies and tools for your scenarios. Cloud Integration allows you to design, deploy, and monitor integration flows between cloud and on-premise systems using various adapters and protocols. API Management allows you to create, publish, secure, and monitor APIs across different environments and platforms. NEW QUESTION # 19

You want to integrate a SOAP adapter into an integration process and enable the adapter to send messages to the integration flow. Which user role must you set up in the SOAP adapter?

- **A. ESBMessaging send**
- B. MessagingsendtoCI
- C. MessagingSend

Answer: A

Explanation:

To integrate a SOAP adapter into an integration process and enable the adapter to send messages to the integration flow, you must set up the ESBMessaging send user role in the SOAP adapter. The ESBMessaging send user role grants the permission to send messages to the Enterprise Service Bus (ESB) of the Cloud Integration capability. The ESB is responsible for routing and delivering messages between different integration flows and adapters. Reference: Modernize Integration with SAP Integration Suite | openSAP

NEW QUESTION # 20

Which SAP offering manages integrations across hybrid and multicloud environments?

- A. SAP process Orchestration manages integrations across hybrid and multicloud environments.
- B. SAP Business Technology Platform manages integrations across hybrid and multicloud environments.
- **C. SAP Integration Suite manages integrations across hybrid and multicloud environments.**
- D. SAP Cloud Platform Integration manages integrations across hybrid and multicloud environments.

Answer: C

Explanation:

SAP Integration Suite is the strategic integration platform-as-a-service (iPaaS) from SAP. It provides a comprehensive set of integration capabilities for hybrid and multicloud landscapes.

It connects on-premise SAP systems, cloud SAP solutions (e.g., S/4HANA Cloud, SuccessFactors, Ariba), and third-party applications.

It offers capabilities like Cloud Integration, API Management, Event Mesh, Open Connectors, and Integration Advisor to support various integration patterns.

SAP explicitly positions Integration Suite as the solution to manage end-to-end integrations across heterogeneous and distributed IT landscapes.

Other options:

SAP Cloud Platform Integration was the older name of Cloud Integration (now part of Integration Suite).

SAP Process Orchestration is the legacy on-premise middleware and not designed for multicloud/hybrid environments.

SAP BTP is the overall platform; integration is only one capability within it.

NEW QUESTION # 21

You use an APIKey for authentication in an HTTPS API call. In which part of the Content Modifier is the APIKey included?

- A. Exchange property
- **B. Message header**
- C. Message body
- D. Attachment

Answer: B

Explanation:

When using API Key authentication for HTTP(S) calls in SAP Integration Suite:

The API Key is typically included in the HTTP header (e.g., APIKey: <value> or x-api-key: <value>).

Message headers are configured in the Content Modifier for outbound requests.

Other options:

Attachment # Used for file handling, not authentication.

Message body # Contains payload, not credentials.

Exchange property # Used internally within the flow, not sent externally.

Thus, the API Key must be placed in the Message header.

NEW QUESTION # 22

What must you do to find out which entity sets are available in the OData V2.0 interface?

- A. Search in the Global Directory of all available OData interfaces.
- B. Retrieve the service document from the interface.
- C. Contact the OData interface manufacturer.
- **D. Retrieve the metadata document from the interface.**

Answer: D

Explanation:

In SAP Integration Development, particularly when working with OData V2.0 interfaces, the correct way to identify the available entity sets is by retrieving the metadata document from the OData service. The metadata document, accessible via the \$metadata endpoint of the OData service, provides a comprehensive description of the service's data model, including all entity sets, entity types, properties, associations, and navigation properties. This document is formatted in XML (CSDL - Conceptual Schema Definition Language) and is essential for understanding the structure and capabilities of the OData service.

Why Option B is Correct:

* Metadata Document Role: The metadata document is a standard feature of OData V2.0 services, as defined by the OData protocol. It exposes the schema of the service, listing all entity sets and their properties. For example, accessing `https://<service-url>/$metadata` returns an XML document detailing the entity sets, such as Customers, Orders, or other resources exposed by the service.

* SAP Reference: According to SAP documentation, such as the SAP Gateway Developer Guide and OData V2.0 Protocol Specification, the metadata document is the primary source for discovering the structure of an OData service. In SAP Gateway,

which is commonly used for OData services in SAP environments, the \$metadata endpoint is automatically generated when an OData service is created using the Service Builder (transaction SEGW).

* Practical Usage: In SAP Integration Suite or SAP Cloud Integration, developers use the metadata document to configure integration flows (iFlows) that interact with OData services. Tools like SAP Business Application Studio or Eclipse with SAP plugins allow developers to import this metadata to generate client code or configure adapters.

Why Other Options are Incorrect:

* A. Retrieve the service document from the interface: The service document (accessed via the root URL of the OData service, e.g., `https://<service-url>/`) provides a list of entity sets but only includes their names and URLs, not the detailed structure (e.g., properties, types, or relationships). While it's useful for navigating to entity sets, it lacks the comprehensive schema information provided by the metadata document, making it insufficient for fully understanding the entity sets' structure.

* C. Search in the Global Directory of all available OData interfaces: There is no such thing as a

"Global Directory" for OData interfaces in SAP or the broader OData ecosystem. OData services are specific to individual systems or applications, and their discovery is typically done via the service's metadata or service document, not a centralized directory.

* D. Contact the OData interface manufacturer: This option is not practical or standard. OData is a protocol, not a product with a "manufacturer." The metadata document is the standard, self-contained way to explore an OData service, and no external contact is required.

SAP Integration Developer Workflow Example:

* Access the OData Service: In an SAP environment, an Integration Developer identifies the OData service URL (e.g., `https://<host>:<port>/sap/opu/odata/sap/<service_name>`).

* Retrieve Metadata: Append `/ $metadata` to the service URL to download the metadata XML. For example, `https://<host>:<port>/sap/opu/odata/sap/ZCUSTOMER_SRV/$metadata`.

* Analyze Entity Sets: Parse the `<EntitySet>` elements in the metadata XML to identify available entity sets, their properties, and navigation paths.

* Use in Integration: In SAP Cloud Integration, import the metadata into an iFlow's OData adapter to configure operations like querying or updating specific entity sets.

References:

SAP Help Portal: SAP Gateway Developer Guide - "OData Service Metadata" section, which explains the role of the \$metadata endpoint in exposing entity sets and their schema.

OData V2.0 Specification: Section 2.2.3.7.1, "Metadata Document," which mandates that OData services provide a metadata document describing entity sets and other resources.

SAP Integration Suite Documentation: "OData Adapter" section, which details how metadata is used to configure integration flows for OData services.

SAP Community Blogs: Articles on OData development in SAP Gateway, such as "Building OData Services with SAP Gateway," emphasize using the metadata document for service exploration.
