EMC Dell Information Storage and Management Foundations v2 Exam Sample Questions (Q40-Q45):

NEW QUESTION # 40

Question:

Which two interfaces does an OSD (Object Storage Device) gateway typically present to applications?

- A. HTTP and HTTPS
- B. SSH and SMB
- C. REST and SOAP APIs
- D. File-based interfaces like NFS and CIFS

Answer: C

Explanation:

OSD gateways provide access to object storage systems through APIs. The most common interfaces are:

* REST (Representational State Transfer): A stateless protocol using standard HTTP methods, widely used for web services.

* SOAP (Simple Object Access Protocol): A protocol for exchanging structured information in web services, using XML.

These APIs allow applications to interact with object storage systems over HTTP/HTTPS protocols.

* SSH and SMB: SSH is for secure shell access; SMB is for file sharing, not typically used for object storage.

* HTTP and HTTPS: These are transport protocols; while used by REST and SOAP, they are not interfaces themselves.

* NFS and CIFS: File-based interfaces, not used for object storage.

NEW QUESTION # 41

Question:

An IT department needs to execute automated tasks to perform a business operation. They require workflows for arranging, coordinating, and managing these tasks. Which layer of the Modern Data Center Architecture provides this functionality?

- A. Services
- **B. Orchestration**
- C. Physical infrastructure
- D. Virtual infrastructure

Answer: B

Explanation:

The orchestration layer in a modern data center architecture is responsible for automating and coordinating complex tasks and workflows. It enables the integration and management of various services and resources to perform business operations efficiently.

* Physical infrastructure:Comprises the hardware components.

* Virtual infrastructure:Includes virtualized resources like VMs.

* Services:Deliver specific functionalities to end-users.

NEW QUESTION # 42

Question:

What is the maximum number of VLANs that can be supported with one VLAN tag field?

- A. 0
- **B. 1**
- C. 2
- D. 3

Answer: B

Explanation:

In Ethernet networking, VLANs (Virtual Local Area Networks) are identified using a 12-bit VLAN ID field in the IEEE 802.1Q standard. Since 12 bits can represent $2^{12} = 4096$ unique values, the maximum number of VLANs that can be supported is 4096.

* 1024 and 2048: These values are less than the maximum and represent subsets of possible VLANs.

* 8192: This exceeds the 12-bit limit and is not supported by the standard.

NEW QUESTION # 43

Question:

A company needs to rebuild a failed disk in its RAID 5 array. Which two factors would significantly impact the rebuild time?

- **A. Capacity of the failed disk**
- B. Network bandwidth between the server and the storage array
- **C. Write performance of the remaining disks**
- D. Capacity of the cache memory

Answer: A,C

Explanation:

Rebuilding a RAID 5 array after a disk failure depends on:

Capacity of the failed disk (C)- More data means longer rebuild time.

Write performance of the remaining disks (B)- Rebuild involves recalculating parity and writing data to the replacement disk, which stresses the surviving disks.

* Network bandwidth (A)is only relevant for accessing the array, not for internal rebuild operations.

* Cache capacity (D)helps performance in some scenarios, but the direct factors are disk size and performance.

NEW QUESTION # 44

Question:

An IT team needs to reduce or eliminate data frame loss during times of network congestion in their converged Ethernet network. What standard should they implement?

- A. DCB
- B. QoS
- C. VLAN
- D. NAT

Answer: A

Explanation:

Data Center Bridging (DCB)is a set of IEEE standards designed to enhance Ethernet for converged data center networks.

DCB includespriority-based flow control (PFC)toreduce frame lossduring congestion.

Ensureslossless Ethernet transport, crucial for storage traffic (like FCoE).

* QoS (A)prioritizes traffic but doesn't guarantee lossless transport.

* NAT (C)translates IP addresses, not relevant to lossless transport.

* VLAN (D)segments networks logically but doesn't address congestion.
