

Download Oracle 1z1-076 exam Dumps and start preparation today

What's more, part of that Prep4pass 1z1-076 dumps now are free: <https://drive.google.com/open?id=1qpOVMPTazCy90KS4iNSMPD4sUFer-zlJ>

Our Oracle 1z1-076 Exam Dumps with the highest quality which consists of all of the key points required for the Oracle 1z1-076 exam can really be considered as the royal road to learning. Prep4pass has already become a famous brand all over the world in this field since we have engaged in compiling the 1z1-076 practice materials for more than ten years and have got a fruitful outcome.

Oracle 1z1-076 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Using Oracle Active Data Guard: Supported Workloads in Read-Only Standby Databases: Here, the usage of physical standby databases for real-time queries is discussed.
Topic 2	<ul style="list-style-type: none">Enhanced Client Connectivity in a Data Guard Environment: This topic focuses on enhancing client connectivity in a Data Guard setup and implementing failover procedures for seamless client redirection. It also covers application continuity to ensure uninterrupted operations during role transitions.
Topic 3	<ul style="list-style-type: none">Creating a Data Guard Broker Configuration: This section delves into the practical aspects of creating and managing a Data Guard broker configuration, including command-line and Enterprise Manager approaches.
Topic 4	<ul style="list-style-type: none">Backup and Recovery Considerations in an Oracle Data Guard Configuration: In this topic, Backup and recovery procedures in a Data Guard configuration are discussed, including RMAN backups, offloading to physical standby, and network-based recovery.
Topic 5	<ul style="list-style-type: none">Performing Role Transitions: Here, the concept of database roles is explained, along with the steps for performing switchovers, failovers, and maintaining physical standby sessions during role transitions.

Topic 6	<ul style="list-style-type: none"> • Oracle Data Guard Basics: This topic covers the essential architecture and concepts of Oracle Data Guard. It includes sub-topics such as the physical and logical standby database comparison, benefits of Data Guard, and its integration with multi-tenant databases.
Topic 7	<ul style="list-style-type: none"> • Using Flashback Database in a Data Guard Configuration: This topic covers the configuration and advantages of using Flashback Database in a Data Guard setup, as well as the process of enabling fast-start failover for seamless role changes.
Topic 8	<ul style="list-style-type: none"> • Oracle Data Guard Broker Basics: An overview of the Data Guard broker, its architecture, components, benefits, and configurations, is provided here. It serves as an introduction to the tool used for managing Data Guard configurations.

2026 1z1-076 – 100% Free New Test Discount | Trustable Reliable 1z1-076 Exam Practice

The actual Oracle 1z1-076 exam questions are in PDF format for the one who wants to study offline. The actual Oracle 1z1-076 exam questions are in simple PDF form. The PDF format is suitable both for smartphones as well as tablets. You can print documents and study anywhere. The plus point is that the PDF version is updated regularly to improve its 1z1-076 Exam Questions and reflect changes in the syllabus of the exam.

Oracle Database 19c: Data Guard Administration Sample Questions (Q23-Q28):

NEW QUESTION # 23

Which three Data Guard monitoring activities may be performed using Enterprise Manager Cloud Control?

- A. You can check the potential data loss in the event of a disaster.
- B. You can set a warning threshold on the redo generation rate metric for a physical standby database.
- C. You can check if redo apply needs to be tuned.
- D. You can monitor the redo apply rate on a logical standby database.
- E. You can monitor the redo apply rate on a snapshot standby database.
- F. You can set a critical threshold on the redo generation rate metric for a primary database.

Answer: A,D,F

Explanation:

Enterprise Manager Cloud Control offers comprehensive monitoring capabilities for Oracle Data Guard environments. It enables monitoring the rate at which redo is being applied on a logical standby database (A), which is crucial for ensuring that the standby database is keeping up with the changes from the primary. It also allows setting thresholds on performance metrics, such as the redo generation rate on the primary database (B), to alert administrators when values exceed critical or warning thresholds. Additionally, it provides the capability to estimate the potential data loss in the event of a disaster (E), helping in disaster recovery planning and ensuring business continuity.

Reference:

Oracle Enterprise Manager Cloud Control documentation provides extensive information on its monitoring features for Oracle Data Guard, including setting thresholds, estimating potential data loss, and tracking redo apply rates.

NEW QUESTION # 24

On your logical standby database, you specified these rules:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML',-
  SCHEMA_NAME => 'HR', -
  OBJECT_NAME => 'EMP_NEW');

SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML',-
  SCHEMA_NAME => 'HR', -
  OBJECT_NAME => 'EMP_OLD');
```

After completion of the weekend batch cycle you attempt to delete the SQL Apply filters:

```
SQL> EXECUTE DBMS_LOGSTDBY.UNSKIP (STMT => 'DML',-
  SCHEMA_NAME => 'HR', -
  OBJECT_NAME => 'EMP%');
```

Which is TRUE regarding the execution of the UNSKIP procedure?

- A. It succeeds only if SQL apply is stopped before deleting the SQL Apply filter.
- B. It succeeds but the SQL Apply filters are not deleted.
- C. It returns an error because the syntax to delete a SQL Apply filter must specify the same object names as specified when the filter was added.
- **D. It deletes both the SQL Apply filters.**
- E. It succeeds only if all DML statements executed on the primary have been applied on the logical standby deleting the SQL Apply filter.

Answer: D

Explanation:

The execution of the UNSKIP procedure is designed to remove SQL Apply filters that have been previously set up on a logical standby database. Based on the provided statements, the UNSKIP procedure is directed to delete any SQL Apply filters for DML statements associated with objects in the 'HR' schema that start with 'EMP'. Since both SKIP procedures had the same schema name ('HR') and statement type ('DML'), and the UNSKIP procedure uses a wildcard (%) for the object name, it will successfully remove both of the SQL Apply filters for 'EMP_NEW' and 'EMP_OLD', as both object names match the pattern provided in the UNSKIP procedure.

Reference:

Oracle's Data Guard documentation and SQL Language Reference provide insights into managing SQL Apply filters on a logical standby database using the DBMS_LOGSTDBY package. This includes adding and removing filters through SKIP and UNSKIP procedures.

NEW QUESTION # 25

In Oracle Database 19c, you can set the value of database initialization parameters in a database using the EDIT DATABASE... SET PARAMETER Command:

```
DGMGRL> EDIT DATABASE 'boston' SET PARAMETER log_archive_trace - 1;
```

Which THREE statements are TRUE about the command?

- A. The EDIT DATABASE PARAMETER command can be used to set the value of a static parameter in a database.
- **B. The edit database parameter command can only be used to modify the value of a dynamic parameter in a database.**
- **C. The database must be available when the above command is run.**
- D. The value set using this command is directly stored in the broker configuration file.
- **E. The value set using this command is directly applied to the boston database.**

Answer: B,C,E

Explanation:

The EDIT DATABASE...SET PARAMETER command in Data Guard Management (DGMGRL) is used to modify the value of initialization parameters for a database within a Data Guard configuration. This command can be used to modify both static and dynamic parameters, but if a static parameter is changed, the new value will take effect only after the database is restarted. The database must be up and running for the command to execute, and the values set using the command are directly applied to the specified database (in this case, 'boston').

NEW QUESTION # 26

Which three statements are true about snapshot standby databases?

- **A. Tablespaces can be created.**
- B. The switchover TO command allows a switchover operation to a snapshot standby database.
- C. A logical standby database can be converted into a snapshot standby database.
- **D. Tables can be dropped.**
- **E. Tablespaces can be dropped.**
- F. The FAILOVER TO command results in a transition of a snapshot standby database to the primary role.

Answer: A,D,E

Explanation:

A snapshot standby database is a fully updateable standby database that is created by converting a physical standby database into a snapshot standby database. The main characteristics of a snapshot standby database include:

B: Tablespaces can indeed be dropped in a snapshot standby database because it is updateable and allows all types of DML and DDL operations that do not conflict with the standby role.

C: Tablespaces can be created in a snapshot standby database for the same reasons that they can be dropped; it supports all operations that do not interfere with its standby nature.

E: Tables can be dropped in a snapshot standby database, as it is a fully updateable standby.

Options A and D are incorrect because 'FAILOVER TO' and 'SWITCHOVER TO' commands are not used with snapshot standby databases in these contexts. A failover converts a standby database into the primary role after the original primary has become unavailable, and is not a reversible role transition. Switchover is a planned role reversal between the primary database and one of its standby databases and is not applicable to snapshot standby databases in the context provided.

Option F is incorrect because a logical standby database cannot be converted into a snapshot standby database directly. A logical standby is used for different purposes such as reporting and querying with real-time data, and its structure is different from a physical standby which can be converted into a snapshot standby.

NEW QUESTION # 27

Which TWO statements are true about configuring Oracle Net Service in a Data Guard environment?

- A. Install the oracle-database-preinstall-19c package to set the kernel parameters for Oracle Net based on the Data Guard best practice guidelines.
- B. It is necessary to use the failover clause for an address_list with multiple address lists in the tnsnames.ora file.
- **C. Installing the oracle-database-preinstall-19c package is NOT sufficient to set up operating system kernel parameters for Oracle Net.**
- **D. A static service must be registered with the local listener to enable DGMGRL to restart instances during the course of broker operations.**
- E. Enterprise Manager does not require static service registration to restart instances during the course of broker operations.

Answer: C,D

Explanation:

A static service must be registered with the local listener to enable DGMGRL to restart instances during the course of broker operations (A): For DGMGRL (Data Guard Manager Command-Line Interface) to perform instance management operations, such as restarting instances, a static service registration in the listener is required. This allows the broker to connect to the database instance even when the instance is not fully up and the dynamic service registration is not available.

Installing the oracle-database-preinstall-19c package is NOT sufficient to set up operating system kernel parameters for Oracle Net (C): While the oracle-database-preinstall-19c package automates the setting of several kernel parameters to meet the preinstallation requirements for Oracle Database, it does not specifically tailor all settings for Oracle Net in a Data Guard configuration. Additional manual configuration may be required to optimize Oracle Net services for Data Guard operations.
