At this time, you will stand out in the interview among other candidates with the Associate-Developer-Apache-Spark-3.5 certification. Constant improvement is significant to your career development. Your current achievements cannot represent your future success. Never stop advancing. Come to study our Associate-Developer-Apache-Spark-3.5 Learning Materials. Stick to the end, victory is at hand. Action always speaks louder than words. With the help of our Associate-Developer-Apache-Spark-3.5 study questions, you can reach your dream in the least time.

To maintain relevancy and top standard of Databricks Associate-Developer-Apache-Spark-3.5 exam questions, the ValidVCE has hired a team of experienced and qualified Databricks Associate-Developer-Apache-Spark-3.5 exam trainers. They work together and check every Associate-Developer-Apache-Spark-3.5 exam practice test question thoroughly and ensure the top standard of Associate-Developer-Apache-Spark-3.5 Exam Questions all the time. So you do not need to worry about the relevancy and top standard of Databricks Associate-Developer-Apache-Spark-3.5 exam practice test questions.

2026 Associate-Developer-Apache-Spark-3.5: The Best New Databricks Certified Associate Developer for Apache Spark 3.5 - Python Test Answers

Do not waste further time and money, get real Databricks Associate-Developer-Apache-Spark-3.5 pdf questions and practice test software, and start Associate-Developer-Apache-Spark-3.5 test preparation today. ValidVCE will also provide you with up to 365 days of free exam questions updates. Free demo of Associate-Developer-Apache-Spark-3.5 Dumps PDF allowing you to try before you buy and one-year free update will be allowed after purchased.

Databricks Certified Associate Developer for Apache Spark 3.5 - Python Sample Questions (Q96-Q101):

NEW QUESTION # 96

A data engineer wants to write a Spark job that creates a new managed table. If the table already exists, the job should fail and not modify anything.

Which save mode and method should be used?

- A. save with mode Ignore
- B. saveAsTable with mode Overwrite
- **C. saveAsTable with mode ErrorIfExists**
- D. save with mode ErrorIfExists

Answer: C

Explanation:

The method `saveAsTable()` creates a new table and optionally fails if the table exists.

From Spark documentation:

"The mode 'ErrorIfExists' (default) will throw an error if the table already exists." Thus:

Option A is correct.

Option B (Overwrite) would overwrite existing data - not acceptable here.

Option C and D use `save()`, which doesn't create a managed table with metadata in the metastore.

Final answer: A

NEW QUESTION # 97

A data analyst builds a Spark application to analyze finance data and performs the following operations: `filter`, `select`, `groupBy`, and `coalesce`.

Which operation results in a shuffle?

- A. `filter`
- B. `coalesce`
- C. `select`
- D. `groupBy`

Answer: D

Explanation:

The `groupBy()` operation causes a shuffle because it requires all values for a specific key to be brought together, which may involve moving data across partitions.

In contrast:

`filter()` and `select()` are narrow transformations and do not cause shuffles.

`coalesce()` tries to reduce the number of partitions and avoids shuffling by moving data to fewer partitions without a full shuffle (unlike `repartition()`).

NEW QUESTION # 98

What is the relationship between jobs, stages, and tasks during execution in Apache Spark?

Options:

- A. A stage contains multiple tasks, and each task contains multiple jobs.
- B. A stage contains multiple jobs, and each job contains multiple tasks.
- C. A job contains multiple stages, and each stage contains multiple tasks.
- D. A job contains multiple tasks, and each task contains multiple stages.

Answer: C

Explanation:

A Spark job is triggered by an action (e.g., `count`, `show`).

The job is broken into stages, typically one per shuffle boundary.

Each stage is divided into multiple tasks, which are distributed across worker nodes.

NEW QUESTION # 99

Which UDF implementation calculates the length of strings in a Spark DataFrame?

- A. `df.withColumn("length", spark.udf("len", StringType()))`
- B. `df.select(length(col("stringColumn")).alias("length"))`
- C. `df.withColumn("length", udf(lambda s: len(s), StringType()))`
- D. `spark.udf.register("stringLength", lambda s: len(s))`

Answer: B

Explanation:

Option B uses Spark's built-in SQL function `length()`, which is efficient and avoids the overhead of a Python UDF:

```
from pyspark.sql.functions import length, col
df.select(length(col("stringColumn")).alias("length"))
```

Explanation of other options:

Option A is incorrect syntax; `spark.udf` is not called this way.

Option C registers a UDF but doesn't apply it in the DataFrame transformation.

Option D is syntactically valid but uses a Python UDF which is less efficient than built-in functions.

Final answer: B

NEW QUESTION # 100

A data engineer is building an Apache Spark™ Structured Streaming application to process a stream of JSON events in real time. The engineer wants the application to be fault-tolerant and resume processing from the last successfully processed record in case of a failure. To achieve this, the data engineer decides to implement checkpoints. Which code snippet should the data engineer use?

- A.

```
query = streaming_df.writeStream \
    .format("console") \
    .outputMode("complete") \
    .start()
```
- B.

```
query = streaming_df.writeStream \
    .format("console") \
    .outputMode("append") \
    .option("checkpointLocation", "/path/to/checkpoint") \
    .start()
```
- C.

```
query = streaming_df.writeStream \
    .format("console") \
    .outputMode("append") \
    .start()
```
- D.

```
query = streaming_df.writeStream \
    .format("console") \
    .option("checkpoint", "/path/to/checkpoint") \
    .outputMode("append") \
    .start()
```

Answer: B

Explanation:

To enable fault tolerance and ensure that Spark can resume from the last committed offset after failure, you must configure a checkpoint location using the correct option key: `"checkpointLocation"`.

From the official Spark Structured Streaming guide:

"To make a streaming query fault-tolerant and recoverable, a checkpoint directory must be specified using `.option("checkpointLocation", "/path/to/dir").`" Explanation of options:

Option A uses an invalid option name: `"checkpoint"` (should be `"checkpointLocation"`) Option B is correct: it sets `checkpointLocation` properly Option C lacks checkpointing and won't resume after failure Option D also lacks checkpointing configuration

NEW QUESTION # 101

.....

ValidVCE also offers you a demo version of the Associate-Developer-Apache-Spark-3.5 exam dumps. Often Associate-Developer-Apache-Spark-3.5 test takers run on a tight budget so they just can not risk wasting it on invalid Databricks Associate-Developer-Apache-Spark-3.5 Study Materials. Thus ValidVCE offers a demo version of Databricks Associate-Developer-Apache-Spark-3.5 actual exam questions before buying it.
