在現在這個競爭激烈的社會裏，有一技之長是可以占很大優勢的。尤其在IT行業中。獲得一些IT認證證書是非常有用的。CompTIA DA0-001 是一個檢驗IT專業知識水準認證考試，在IT行業中也是一個分量相當重的認證考試。因為CompTIA DA0-001考試難度也比較大，所以很多為了通過CompTIA DA0-001 認證考試的人花費了大量的時間和精力學習考試相關知識，但是到最後卻沒有成功。KaoGuTi為此分析了他們失敗的原因，我們得出的結論是他們沒有經過針對性的培訓。現在KaoGuTi的專家們為CompTIA DA0-001 認證考試研究出了針對性的訓練項目，可以幫你花少量時間和金錢卻可以100%通過考試。

CompTIA DA0-001考試涵蓋廣泛的主題，包括數據庫概念、數據建模、數據倉儲、數據可視化和數據安全等。該考試旨在測試候選人在這些領域的實踐知識以及他們應用這些知識在實際情境中的能力。該考試由90道多選題組成，候選人有90分鐘時間完成。

突然發現，很多人對自己未來的所有計劃都有同一個開頭——等我有錢.....但是，IT認證考試不能等。如果你覺得購買 CompTIA 的 DA0-001 考試培訓資料利用它來準備考試是一場冒險，那麼整個生命就是一場冒險，走得最遠的人常常就是願意去做願意去冒險的人。而 KaoGuTi 的 DA0-001 考資料根據最新的考試動態變化而更新，會在

最新的 CompTIA Data+ DA0-001 免費考試真題 (Q134-Q139):

問題 #134

An analyst is working with the income data of suburban families in the United States. The data set has a lot of outliers, and the analyst needs to provide a measure that represents the typical income. Which of the following would BEST fulfill the analyst's goal?

- **A. Median**
- B. Standard deviation
- C. Mode
- D. Mean

答案: A

解題說明:

This is because median is a type of statistical measure that represents the typical value or central tendency of a data set, which means that it divides the data set into two equal halves, such that half of the values are above it and half are below it. Median can be used to provide a measure that represents the typical income of suburban families in the United States, especially when the data set has a lot of outliers, which means that it has values that are unusually high or low compared to the rest of the data set. Median can provide a measure that represents the typical income of suburban families in the United States, because it is not affected or skewed by the outliers, as it only depends on the middle value or the middle two values of the data set, regardless of how extreme or distant the outliers are. For example, median can provide a measure that represents the typical income of suburban families in the United States, by finding the income value that splits the data set into two equal groups of families, such that 50% of the families have higher incomes and 50% have lower incomes.

The other statistical measures are not the best measures to represent the typical income of suburban families in the United States. Here is why:

* Mean is a type of statistical measure that represents the average value or central tendency of a data set, which means that it is the sum of all the values divided by the number of values. Mean is not a good measure to represent the typical income of suburban families in the United States, especially when the data set has a lot of outliers, because it is affected or skewed by the outliers, as it takes into account all the values in the data set, regardless of how extreme or distant they are. For example, mean can provide a measure that does not represent the typical income of suburban families in the United States, by finding the income value that is influenced by a few very high or very low incomes, which could make it higher or lower than most of the incomes in the data set.

* Mode is a type of statistical measure that represents the most frequent value or mode of a data set, which means that it is the value that occurs most often in the data set. Mode is not a good measure to represent the typical income of suburban families in the United States, especially when the data set has a lot of outliers, because it is not representative or indicative of the central tendency or distribution of the data set, as it only depends on the count or occurrence of a single value or a few values in the data set, regardless of how common or rare they are. For example, mode can provide a measure that does not represent the typical income of suburban families in the United States, by finding the income value that is repeated more often than others, which could be an outlier or an anomaly in the data set.

* Standard deviation is a type of statistical measure that represents the amount of dispersion or variation of a data set, which means that it quantifies how much the values in a data set vary or deviate from the mean or average of the data set. Standard deviation is not a measure that represents the typical income of suburban families in the United States, but rather a measure that describes the spread or distribution of their incomes, as well as identifies any outliers or extreme values in their incomes. For example, standard deviation can provide a measure that describes how diverse or homogeneous their incomes are, as well as how far their incomes are from their average income.

問題 #135

A collections manager has a team calling customers who are past due on their accounts in an attempt to collect payments. The manager receives the call list in the form of a printed report that is generated by the accounting department at the beginning of each week. Consequently, the collections team calls some customers who have made payments in the time since the report was last printed. Which of the following reporting enhancements could the accounting department implement to best reduce the number of calls on current accounts?

- A. Include a time stamp on the report.
- **B. Increase the frequency of report generation.**
- C. Add a report run date to the report.
- D. Modify the date range on the report

答案: B

解題說明:

The best reporting enhancement that the accounting department could implement to reduce the number of calls on current accounts is C. Increase the frequency of report generation.

By increasing the frequency of report generation, the accounting department could provide the collections manager with more up-to-date information on the customers who are past due on their accounts. This would help to avoid calling customers who have made payments in the time since the last report was printed, and thus reduce the number of calls on current accounts. Increasing the frequency of report generation would also improve the accuracy and timeliness of the data, and enhance the efficiency and effectiveness of the collections process.

Modifying the date range on the report, including a time stamp on the report, or adding a report run date to the report would not be sufficient to reduce the number of calls on current accounts. These enhancements would only provide information on when the report was generated or what period it covers, but they would not change the fact that the report could be outdated by the time it reaches the collections manager. Therefore, these enhancements would not solve the problem of calling customers who have already paid their accounts.

問題 #136

An analyst needs to provide a chart to identify the composition between the categories of the survey response data set:

Favorite color	Responses
Red	15
Blue	35
Green	25
Yellow	25
Total	100

Which of the following charts would be BEST to use?

- A. Line
- B. Waterfall
- C. Scatter plot
- **D. Pie**
- E. Histogram

答案: D

解題說明:

A pie chart is the best choice to show the composition between the categories of the survey response data set. A pie chart represents the whole with a circle, divided by slices into parts. Each slice shows the relative size of each category as a percentage of the total. A pie chart is useful when the categories are mutually exclusive and add up to 100%. The table shows the favorite color and the number of responses for each color, which can be easily converted into percentages. A pie chart can show how each color contributes to the total number of responses.

Option A is incorrect because a histogram is used to show how data points are distributed along a numerical scale. The survey response data set is not numerical, but categorical.

Option C is incorrect because a line chart is used to show trends or changes over time. The survey response data set does not have a time dimension.

Option D is incorrect because a scatter plot is used to show the relationship between two numerical variables. The survey response data set does not have two numerical variables.

Option E is incorrect because a waterfall chart is used to show how an initial value is increased or decreased by a series of intermediate values. The survey response data set does not have an initial value or intermediate values.

問題 #137

Consider the following dataset which contains information about houses that are for sale:

□ Which of the following string manipulation commands will combine the address and region name columns to create a full address?

full_address----- 85 Turner St, Northern Metropolitan 25 Bloomburg St, Northern Metropolitan 5 Charles St, Northern Metropolitan 40 Federation La, Northern Metropolitan 55a Park St, Northern Metropolitan

- A. SELECT CONCAT(regionname, ' ', address) AS full_address FROM melb LIMIT 5
- B. SELECT CONCAT(regionname, '-', address) AS full_address FROM melb LIMIT 5;
- C. SELECT CONCAT(address, '-', regionname) AS full_address FROM melb LIMIT 5;
- **D. SELECT CONCAT(address, ' ', regionname) AS full_address FROM melb LIMIT 5;**

答案： D

解題說明：

The correct answer is A: SELECT CONCAT(address, ' ', regionname) AS full_address FROM melb LIMIT 5; String manipulation (or string handling) is the process of changing, parsing, splicing, pasting, or analyzing strings. SQL is used for managing data in a relational database. The CONCAT() function adds two or more strings together. Syntax CONCAT(string1, string2,... string_n) Parameter Values Parameter Description string1, string2, string_n Required. The strings to add together.

問題 #138

Zip code, _____, and _____ uniquely identify 87% of people in the United States.

- **A. date of birth, gender**
- B. gender, first name
- C. phone number, email address
- D. first name, last name

答案： A

問題 #139
