Store information in variables

GitHub sets default variables for each GitHub Actions workflow run. You can also set custom variables for use in a single workflow or multiple workflows.

Defining environment variables for a single workflow

To set a custom environment variable for a single workflow, you can define it using the env key in the workflow file. The scope of a custom variable set by this method is limited to the element in which it is defined. You can define variables that are scoped for:

The entire workflow, by using env at the top level of the workflow file.

The contents of a job within a workflow, by using jobs.<job_id>.env.

A specific step within a job, by using jobs.<job_id>.steps[*].env.
