#### NEW QUESTION # 155

A company is using Amazon DynamoDB to stage its product catalog which is 1 GB. Since a product entry on average consists of 100 KB of data, and the average traffic is about 250 requests per second, the database administrator has provisioned 3.000 RCUs of read capacity throughput. However, some products are very popular and users are experiencing delays or timeouts due to throttling. What improvement offers a long-term solution to this problem?

- A. Augment Amazon DynamoDB by storing only the key product attributes, with the details stored on Amazon S3
- **B. Change the partition key to consist of a hash of product key and product type instead of just the product key**
- C. Use Amazon DynamoDB Accelerator to maintain the frequently read items
- D. Increase the throughput provisioning to 6.000 read capacity units (RCUs)

**Answer: B**

#### NEW QUESTION # 156

A company has an existing on-premises three-tier web application. The Linux web servers serve content from a centralized file share on a NAS server because the content is refreshed several times a day from various sources. The existing infrastructure is not optimized and the company would like to move to AWS in order to gain the ability to scale resources up and down in response to load. On-premises and AWS resources are connected using AWS Direct Connect.

How can the company migrate the web infrastructure to AWS without delaying the content refresh process?

- A. Create an on-premises file gateway using AWS Storage Gateway to replace the NAS server and replicate content to AWS. On the AWS side, mount the same Storage Gateway bucket to each web server Amazon EC2 instance to serve the content.
- B. Expose an Amazon EFS share to on-premises users to serve as the NAS server. Mount the same EFS share to the web server Amazon EC2 instances to serve the content.
- **C. Create a cluster of web server Amazon EC2 instances behind a Classic Load Balancer on AWS. Share an Amazon EBS volume among all instances for the content. Schedule a periodic synchronization of this volume and the NAS server.**

- D. Create web server Amazon EC2 instances on AWS in an Auto Scaling group. Configure a nightly process where the web server instances are updated from the NAS server.

**Answer: C**

### NEW QUESTION # 157

What does the AWS Storage Gateway provide?

- A. It provides an encrypted SSL endpoint for backups in the Cloud.
- B. A direct encrypted connection to Amazon S3.
- **C. It allows to integrate on-premises IT environments with Cloud Storage.**
- D. It's a backup solution that provides an on-premises Cloud storage.

**Answer: C**

### NEW QUESTION # 158

A company recently created a disaster recovery site in a Different AWS Region. The company needs to transfer large amounts of data back and forth between NFS file systems in the two Regions on a periodic basis.

Which solution will meet these requirements with the LEAST operational overhead?

- **A. Use AWS DataSync.**
- B. Set up an SFTP server on Amazon EC2
- C. Use AWS Snowball devices
- D. Use AWS Database Migration Service (AWS DMS)

**Answer: A**

Explanation:

Explanation

This option is the most efficient because it uses AWS DataSync, which is a secure, online service that automates and accelerates moving data between on-premises and AWS Storage services<sup>1</sup>. It also uses DataSync to transfer large amounts of data back and forth between NFS file systems in the two Regions on a periodic basis, which simplifies and speeds up the data transfer process with minimal operational overhead.

This solution meets the requirement of transferring large amounts of data back and forth between NFS file systems in the two Regions on a periodic basis with the least operational overhead. Option B is less efficient because it uses AWS Snowball devices, which are physical devices that let you transfer large amounts of data into and out of AWS<sup>2</sup>. However, this does not provide a periodic data transfer solution, as it requires manual handling and shipping of the devices. Option C is less efficient because it sets up an SFTP server on Amazon EC2, which is a way to provide secure file transfer protocol (SFTP) access to files stored in Amazon S3.

However, this does not provide a periodic data transfer solution, as it requires manual initiation and monitoring of the file transfers. Option D is less efficient because it uses AWS Database Migration Service (AWS DMS), which is a service that helps you migrate databases to AWS quickly and securely. However, this does not provide a data transfer solution for NFS file systems, as it only supports relational databases and non-relational data stores.
