Snowflake SnowPro Advanced: Data Engineer Certification Exam Sample Questions (Q220-Q225):

NEW QUESTION # 220

Ryan, a Data Engineer, wants to improve the performance of large, complex queries against large data sets. He decided to Scale up underlying warehouse/cluster. What is correct Snowflake consideration while scaling up so that he can achieve better performance results? [Select all that apply]

- A. Resizing a running warehouse does not impact queries that are already being processed by the warehouse; the additional compute resources, once fully provisioned, are only used for queued and new queries.
- B. Resizing can help reduce the queuing that occurs if a warehouse does not have enough compute resources to process all the queries that are submitted concurrently.
- C. Scaling up is not intended for handling concurrency issues; instead, use additional warehouses to handle the workload or use a multi-cluster warehouse (if this feature is available for your account).
- D. Resizing between a 5XL or 6XL warehouse to a 4XL or smaller warehouse results in a brief period during which the customer is charged for both the new warehouse and the old warehouse while the old warehouse is quiesced.
- E. Snowflake supports resizing a warehouse at any time, even while running.

Answer: A,B,C,D,E

Explanation:

Explanation

Resizing a warehouse generally improves query performance, particularly for larger, more complex queries. It can also help reduce the queuing that occurs if a warehouse does not have enough compute resources to process all the queries that are submitted concurrently. Note that warehouse resizing is not intended for handling concurrency issues; instead, use additional warehouses to handle the workload or use a multi-cluster warehouse (if this feature is available for your account).

Snowflake supports resizing a warehouse at any time, even while running. If a query is running slowly and you have additional queries of similar size and complexity that you want to run on the same warehouse, you might choose to resize the warehouse while it is running; however, note the following:

Larger warehouse size is not necessarily faster; for smaller, basic queries that are already executing quickly, you may not see any significant improvement after resizing.

Resizing a running warehouse does not impact queries that are already being processed by the warehouse; the additional compute resources, once fully provisioned, are only used for queued and new queries.

Resizing between a 5XL or 6XL warehouse to a 4XL or smaller warehouse results in a brief period during which the customer is charged for both the new warehouse and the old warehouse while the old warehouse is quiesced.

NEW QUESTION # 221

A retail company uses Amazon Aurora PostgreSQL to process and store live transactional data.

The company uses an Amazon Redshift cluster for a data warehouse.

An extract, transform, and load (ETL) job runs every morning to update the Redshift cluster with new data from the PostgreSQL database. The company has grown rapidly and needs to cost optimize the Redshift cluster.

A data engineer needs to create a solution to archive historical data. The data engineer must be able to run analytics queries that effectively combine data from live transactional data in PostgreSQL, current data in Redshift, and archived historical data. The solution must keep only the most recent 15 months of data in Amazon Redshift to reduce costs.

Which combination of steps will meet these requirements? (Choose two.)

- A. Create a materialized view in Amazon Redshift that combines live, current, and historical data from different sources.
- B. Configure the Amazon Redshift Federated Query feature to query live transactional data that is in the PostgreSQL database.
- C. Configure Amazon Redshift Spectrum to query live transactional data that is in the PostgreSQL database.
- D. Schedule a monthly job to copy data that is older than 15 months to Amazon S3 by using the UNLOAD command. Delete the old data from the Redshift cluster. Configure Amazon Redshift Spectrum to access historical data in Amazon S3.
- E. Schedule a monthly job to copy data that is older than 15 months to Amazon S3 Glacier Flexible Retrieval by using the UNLOAD command. Delete the old data from the Redshift cluster. Configure Redshift Spectrum to access historical data from S3 Glacier Flexible Retrieval.

Answer: B,D

Explanation:

Choice A ensures that live transactional data from PostgreSQL can be accessed directly within Redshift queries.

Choice C archives historical data in Amazon S3, reducing storage costs in Redshift while still making the data accessible via Redshift Spectrum.

NEW QUESTION # 222

To support Time Travel, Which of the following SQL extensions/parameters/commands have been implemented?

- A. **UNDROP** command for tables, schemas, and databases.
- B. ONSET (time difference in seconds from the present time)
- C. **OFFSET** (time difference in seconds from the present time)
- D. **STATEMENT** (identifier for statement, e.g. query ID)
- E. STATEMENT_ID (identifier for statement, e.g. query ID)
- F. **AT | BEFORE** clause which can be specified in the CREATE ... CLONE commands.

Answer: A,C,D,F

NEW QUESTION # 223

Tasks may optionally use table streams to provide a convenient way to continuously process new or changed data. A task can transform new or changed rows that a stream surfaces. Each time a task is scheduled to run, it can verify whether a stream contains change data for a table and either consume the change data or skip the current run if no change data exists. Which System Function can be used by Data engineer to verify whether a stream contains changed data for a table?

- A. SYSTEM\$STREAM_CDC_DATA
- B. **SYSTEM\$STREAM_HAS_DATA**
- C. SYSTEM\$STREAM_HAS_CHANGE_DATA
- D. SYSTEM\$STREAM_DELTA_DATA

Answer: B

Explanation:

Explanation

SYSTEM\$STREAM_HAS_DATA

Indicates whether a specified stream contains change data capture (CDC) records.

NEW QUESTION # 224

A data engineer is processing and analyzing multiple terabytes of raw data that is in Amazon S3.

The data engineer needs to clean and prepare the data. Then the data engineer needs to load the data into Amazon Redshift for analytics.

The data engineer needs a solution that will give data analysts the ability to perform complex queries. The solution must eliminate the need to perform complex extract, transform, and load (ETL) processes or to manage infrastructure.

Which solution will meet these requirements with the LEAST operational overhead?

- A. **Use AWS Glue DataBrew to prepare the data. Use AWS Glue to load the data into Amazon Redshift. Use Amazon Redshift to run queries.**
- B. Use Amazon EMR to prepare the data. Use AWS Step Functions to load the data into Amazon Redshift. Use Amazon QuickSight to run queries.
- C. Use AWS Glue to prepare the data. Use AWS Database Migration Service (AWS DMS) to load the data into Amazon Redshift. Use Amazon Redshift Spectrum to run queries.
- D. Use AWS Lambda to prepare the data. Use Amazon Kinesis Data Firehose to load the data into Amazon Redshift. Use Amazon Athena to run queries.

Answer: A
