The Channel Partner Program AWS Certified Solutions Architect - Professional (SAP-C02) SAP-C02 certification enables you to move ahead in your career later. With the Amazon SAP-C02 certification exam you can climb up the corporate ladder faster and achieve your professional career objectives. Do you plan to enroll in the AWS Certified Solutions Architect - Professional (SAP-C02) SAP-C02 Certification Exam? Looking for a simple and quick way to crack the Amazon SAP-C02 test?

The second format is a web-based format that can be accessed from browsers like Firefox, Microsoft Edge, Chrome, and Safari. It means you don't need to download or install any software or plugins to take the AWS Certified Solutions Architect - Professional (SAP-C02) practice test. The web-based format of the Amazon SAP-C02 Certification Exams practice test supports all operating systems. The third and last format is desktop software format which can be accessed after installing the software on your AWS Certified Solutions Architect - Professional (SAP-C02) (SAP-C02) Windows Pc or Laptop. These formats are built especially for the students so they don't stop preparing for the AWS Certified Solutions Architect - Professional (SAP-C02) (SAP-C02) certification.

Amazon SAP-C02 Reliable Mock Test | SAP-C02 Authorized Exam Dumps

Our SAP-C02 exam braindumps have become a brand that is good enough to stand out in the market. The high quality product like our SAP-C02 study quiz has no need to advertise everywhere, and exerts influential effects which are obvious and everlasting during your preparation. The exam candidates of our SAP-C02 Study Materials are the best living and breathing ads. Just look at the comments on the SAP-C02 training guide, you will know that how popular they are among the candidates.

Amazon AWS Certified Solutions Architect - Professional (SAP-C02) Sample Questions (Q244-Q249):

NEW QUESTION # 244

Question:

How can applications in multiple AWS accounts privately access a PostgreSQL RDS instance in a separate AWS account, while managing the number of connections?

- A. VPC Peering + Application Load Balancer
- B. Transit Gateway + NAT Gateway
- **C. RDS Proxy + PrivateLink via NLB**
- D. VPC Peering + NAT Gateway

Answer: C

Explanation:

RDS Proxy optimizes and pools DB connections. By combining this with PrivateLink + NLB, other accounts can securely access the proxy endpoint without going over the internet or setting up peering for every new account.

#RDS Proxy Docs

NEW QUESTION # 245

A retail company is hosting an ecommerce website on AWS across multiple AWS Regions. The company wants the website to be operational at all times for online purchases. The website stores data in an Amazon RDS for MySQL DB instance.

Which solution will provide the HIGHEST availability for the database?

- A. Configure automated backups on Amazon RDS. In the case of disruption, promote an automated backup to be a standalone DB instance. Direct database traffic to the promoted DB instance. Create a replacement read replica that has the promoted DB instance as its source.
- B. Configure global tables and read replicas on Amazon RDS. Activate the cross-Region scope. In the case of disruption, use AWS Lambda to copy the read replicas from one Region to another Region.
- **C. Configure read replicas on Amazon RDS. In the case of disruption, promote a cross-Region read replica to be a standalone DB instance. Direct database traffic to the promoted DB instance. Create a replacement read replica that has the promoted DB instance as its source.**
- D. Configure global tables and automated backups on Amazon RDS. In the case of disruption, use AWS Lambda to copy the read replicas from one Region to another Region.

Answer: C

Explanation:

This solution will provide the highest availability for the database, as the read replicas will allow the database to be available in multiple Regions, thus reducing the chances of disruption. Additionally, the promotion of the cross-Region read replica to become a standalone DB instance will ensure that the database is still available even if one of the Regions experiences disruptions.

NEW QUESTION # 246

A solutions architect needs to review the design of an Amazon EMR cluster that is using the EMR File System (EMRFS). The cluster performs tasks that are critical to business needs. The cluster is running Amazon EC2 On-Demand Instances at all times for all task, primary, and core nodes. The EMR tasks run each morning, starting at 1:00 AM, and take 6 hours to finish running. The amount of time to complete the processing is not a priority because the data is not referenced until late in the day.

The solutions architect must review the architecture and suggest a solution to minimize the compute costs.

Which solution should the solutions architect recommend to meet these requirements?

- A. Continue to launch all nodes on On-Demand Instances. Terminate the cluster, including all instances, when the processing is completed. Purchase Compute Savings Plans to cover the On-Demand Instance usage.
- B. Launch the primary and core nodes on On-Demand Instances. Launch the task nodes on Spot Instances in an instance fleet. Terminate the cluster, including all instances, when the processing is completed. Purchase Compute Savings Plans to cover the On-Demand Instance usage.
- C. Launch the primary and core nodes on On-Demand Instances. Launch the task nodes on Spot Instances in an instance fleet. Terminate only the task node instances when the processing is completed. Purchase Compute Savings Plans to cover the On-Demand Instance usage.
- **D. Launch all task, primary, and core nodes on Spot Instances in an instance fleet. Terminate the cluster, including all instances, when the processing is completed.**

Answer: D

Explanation:

Amazon EC2 Spot Instances offer spare compute capacity at steep discounts compared to On-Demand prices.

Spot Instances can be interrupted by EC2 with two minutes of notification when EC2 needs the capacity back.

Amazon EMR can handle Spot interruptions gracefully by decommissioning the nodes and redistributing the tasks to other nodes. By launching all nodes on Spot Instances in an instance fleet, the solutions architect can minimize the compute costs of the EMR cluster.

An instance fleet is a collection of EC2 instances with different types and sizes that EMR automatically provisions to meet a defined target capacity. By terminating the cluster when the processing is completed, the solutions architect can avoid paying for idle resources.

NEW QUESTION # 247

A financial services company sells its software-as-a-service (SaaS) platform for application compliance to large global banks. The SaaS platform runs on AWS and uses multiple AWS accounts that are managed in an organization in AWS Organizations. The SaaS platform uses many AWS resources globally.

For regulatory compliance, all API calls to AWS resources must be audited, tracked for changes, and stored in a durable and secure data store.

Which solution will meet these requirements with the LEAST operational overhead?

- A. Create a new AWS CloudTrail trail in each member account of the organization. Create new Amazon S3 buckets to store the logs. Deploy the trail to all AWS Regions. Enable MFA delete and encryption on the S3 buckets.
- B. Create a new AWS CloudTrail trail in the organization's management account. Create a new Amazon S3 bucket to store the logs. Configure Amazon Simple Notification Service (Amazon SNS) to send log-file delivery notifications to an external management system that will track the logs. Enable MFA delete and encryption on the S3 bucket.
- **C. Create a new AWS CloudTrail trail in the organization's management account. Create a new Amazon S3 bucket with versioning turned on to store the logs. Deploy the trail for all accounts in the organization. Enable MFA delete and encryption on the S3 bucket.**
- D. Create a new AWS CloudTrail trail. Use an existing Amazon S3 bucket in the organization's management account to store the logs. Deploy the trail to all AWS Regions. Enable MFA delete and encryption on the S3 bucket.

Answer: C

Explanation:

The correct answer is C. This option uses AWS CloudTrail to create a trail in the organization's management account that applies to all accounts in the organization. This way, the company can centrally manage and audit all API calls to AWS resources across multiple accounts and regions. The company also needs to create a new Amazon S3 bucket with versioning turned on to store the logs. Versioning helps protect against accidental or malicious deletion of log files by keeping multiple versions of each object in the bucket. The company also needs to enable MFA delete and encryption on the S3 bucket to further enhance the security and durability of the data store.

Option A is incorrect because it uses an existing S3 bucket in the organization's management account to store the logs. This may not be optimal for regulatory compliance, as the existing bucket may have different permissions, encryption settings, or lifecycle policies than a dedicated bucket for CloudTrail logs.

Option B is incorrect because it requires creating a new CloudTrail trail in each member account of the organization. This adds operational overhead and complexity, as the company would need to manage multiple trails and S3 buckets across multiple accounts and regions.

Option D is incorrect because it requires configuring Amazon SNS to send log-file delivery notifications to an external management system that will track the logs. This adds unnecessary complexity and cost, as CloudTrail already provides log-file integrity validation and log-file digest delivery features that can help verify the authenticity and integrity of log files.

NEW QUESTION # 248

An events company runs a ticketing platform on AWS. The company's customers configure and schedule their events on the platform. The events result in large increases of traffic to the platform. The company knows the date and time of each customer's events. The company runs the platform on an Amazon Elastic Container Service (Amazon ECS) cluster. The ECS cluster consists of

Amazon EC2 On-Demand Instances that are in an Auto Scaling group. The Auto Scaling group uses a predictive scaling policy. The ECS cluster makes frequent requests to an Amazon S3 bucket to download ticket assets. The ECS cluster and the S3 bucket are in the same AWS Region and the same AWS account. Traffic between the ECS cluster and the S3 bucket flows across a NAT gateway. The company needs to optimize the cost of the platform without decreasing the platform's availability. Which combination of steps will meet these requirements? (Select TWO)

- A. Enable S3 Transfer Acceleration on the S3 bucket
- B. Replace the predictive scaling policy with scheduled scaling policies for the scheduled events
- **C. Create a gateway VPC endpoint for the S3 bucket**
- D. Create On-Demand Capacity Reservations for the applicable instance type for the time period of the scheduled scaling policies
- **E. Add another ECS capacity provider that uses an Auto Scaling group of Spot Instances. Configure the new capacity provider strategy to have the same weight as the existing capacity provider strategy**

Answer: C,E

Explanation:

* Gateway VPC Endpoint for S3:

* Create a gateway VPC endpoint for Amazon S3 in your VPC. This allows instances in your VPC to communicate with Amazon S3 without going through the internet, reducing data transfer costs and improving security.

* Add Spot Instances to ECS Cluster:

* Add another ECS capacity provider that uses an Auto Scaling group of Spot Instances. Configure this new capacity provider to share the load with the existing On-Demand Instances by setting an appropriate weight in the capacity provider strategy. Spot Instances offer significant cost savings compared to On-Demand Instances.

* Configure Capacity Provider Strategy:

* Adjust the ECS service's capacity provider strategy to utilize both On-Demand and Spot Instances effectively. This ensures a balanced distribution of tasks across both instance types, optimizing cost while maintaining availability.

By implementing a gateway VPC endpoint for S3 and incorporating Spot Instances into the ECS cluster, the company can significantly reduce operational costs without compromising on the availability or performance of the platform.
