## Salesforce Certified Platform Developer I Sample Questions (Q220-Q225):

### NEW QUESTION # 220

The following automations already exist on the Account object;

\* A workflow rule that updates a field when a certain criteria is met

- \* A custom validation on a field
  - \* A Flow that updates related contact records
- A developer created a trigger on the Account object.

What should the developer consider while testing the trigger code?

- **A. The trigger may fire multiple times during a transaction.**
- B. A workflow rule field update will cause the custom validation to run again.
- C. Workflow rules will fire only after the trigger has committed all DML operations to the database.
- D. The flow may be launched multiple times.

**Answer: A**

Explanation:

A trigger may fire multiple times during a transaction because of the order of execution of different automation tools in Salesforce. According to the documentation, the order of execution is as follows:

- \* Executes all before triggers.
- \* Saves the record to the database, but doesn't commit yet.
- \* Executes all after triggers.
- \* Executes assignment rules.
- \* Executes auto-response rules.
- \* Executes workflow rules.
- \* If there are workflow field updates, updates the record again.
- \* If the record was updated with workflow field updates, fires before update triggers and after update triggers one more time (and only one more time), in addition to standard validations. Custom validation rules, duplicate rules, and escalation rules are not run again.
- \* Executes processes and flows launched via processes and flow trigger workflow actions. When a process or flow executes a DML operation, the affected record goes through the save procedure.
- \* Executes escalation rules.
- \* Executes entitlement rules.
- \* If the record contains a roll-up summary field or is part of a cross-object workflow, performs calculations and updates the roll-up summary field in the parent record. Parent record goes through save procedure.
- \* If the parent record is updated, and a grandparent record contains a roll-up summary field or is part of a cross-object workflow, performs calculations and updates the roll-up summary field in the grandparent record. Grandparent record goes through save procedure.
- \* Executes Criteria Based Sharing evaluation.
- \* Commits all DML operations to the database.
- \* Executes post-commit logic, such as sending email.

As you can see, there are several steps that can cause the record to go through the save procedure again, which will fire the triggers again. Therefore, the developer should consider this possibility and write the trigger code accordingly to avoid unwanted side effects or recursion. For example, the developer can use static variables to track the trigger invocation or use bulkified patterns to handle collections of records efficiently.

### NEW QUESTION # 221

A developer creates a batch Apex job to update a large number of records, and receives reports of the job timing out and not completing.

What is the first step towards troubleshooting the issue?

- A. Disable the batch job and recreate it with a smaller number of records.
- **B. Check the asynchronous job monitoring page to view the job status and logs.**
- C. Check the debug logs for the batch job.
- D. Decrease the batch size to reduce the load on the system.

**Answer: B**

### NEW QUESTION # 222

A developer observes that an Apex test method fails in the Sandbox. To identify the issue, the developer copies the code inside the test method and executes it via the Execute Anonymous tool in the Developer Console. The code then executes with no exceptions

or errors. Why did the test method fail in the sandbox and pass in the Developer Console?

- A. The test method has a syntax error in the code.
- B. The test method is calling an @future method.
- **C. The test method relies on existing data in the sandbox.**
- D. The test method does not use System.runAs to execute as a specific user.

**Answer: C**

Explanation:

Apex test methods should not depend on existing data in the sandbox, because they may not have access to the same data when they run in a different environment, such as production. Test methods should create their own test data, or use the @testSetup annotation to create common test data for all test methods in a class<sup>12</sup>. The Execute Anonymous tool runs the code in the context of the current user and the current data, so it may not reproduce the same behavior as the test method<sup>3</sup>. References:
