We have been always trying to make every effort to consolidate and keep a close relationship with customer by improving the quality of our 800-150 practice materials. So our 800-150 learning guide is written to convey not only high quality of them, but in a friendly, helpfully, courteously to the points to secure more complete understanding for you. And the content of our 800-150 study questions is easy to understand.

Cisco Supporting Cisco Devices for Field Technicians Sample Questions (Q50-Q55):

NEW QUESTION # 50

Drag and drop the Cisco UCS components from the left onto the corresponding functionalities on the right.

Answer:

Explanation:

Explanation:

According to FLDTEC documentation and Cisco UCS architecture guides, each of these elements plays a distinct and essential role: Fabric Interconnects (FI)- Act as the central switching and management point for the UCS domain, connecting servers to LAN and SAN.

Virtual Interface Cards (VICs)- Installed in servers, these adapters support virtualization of multiple NICs and HBAs, enabling dynamic profile assignment.

Fabric Extenders (FEXs)- Extend the I/O fabric from the FI to the chassis, reducing complexity and consolidating management.

Servers- Provide the actual compute resources and run workloads. These can be blade or rack servers housed in the UCS chassis. This structure is critical to the Cisco Unified Fabric approach, which simplifies data center management through integration and automation.

NEW QUESTION # 51

Which two configuration parameters are most critical to ensure optimal performance when configuring a network port for a newly installed IP phone in an enterprise environment? (Choose two.)

- A. Power over Ethernet
- B. Spanning Tree Protocol
- C. QoS classification
- D. Link aggregation
- E. VLAN assignment

Answer: A,E

Explanation:

When configuring a network port for a newly installed IP phone, two critical parameters to ensure optimal performance are:

VLAN Assignment: Assigning the correct VLANs is essential for segregating voice and data traffic. Typically, a separate voice VLAN is configured to prioritize voice traffic and enhance security.

Power over Ethernet (PoE): PoE allows the switch to supply power to the IP phone over the same Ethernet cable used for data transmission. This eliminates the need for separate power supplies and simplifies installation.

While QoS classification (Option E) is important for prioritizing voice traffic, it is typically configured at a broader network level. Link aggregation (Option B) and Spanning Tree Protocol (Option C) are more relevant to network redundancy and loop prevention, respectively, and are not directly critical for the initial configuration of an IP phone port.

NEW QUESTION # 52

What is the primary purpose of backing up the endpoint configuration prior to replacing the device?

- A. To update the firmware of the device
- B. To generate a performance report for the old device
- C. To troubleshoot network connectivity issues
- D. To restore settings on the new device after replacement

Answer: D

Explanation:

Backing up the configuration of a network device before replacement is a critical step to ensure business continuity and minimize downtime. The primary purpose of this backup is to restore the existing settings onto the new device, ensuring that it operates identically to the one being replaced.

This process includes preserving interface configurations, routing protocols, access control lists, and other essential parameters. By restoring the backed-up configuration to the new device, network administrators can quickly reintegrate it into the network infrastructure without the need for manual reconfiguration, thereby reducing the risk of errors and service disruptions.

Options A, B, and C do not align with the primary objective of configuration backups in the context of device replacement.

NEW QUESTION # 53

Which two components are accessed by removing the chassis cover on Cisco Catalyst 8000 Series Edge platforms? (Choose two.)

- A. Fan trays
- B. Transceivers
- C. SSDs
- D. Network Interface Modules
- E. DIMMs

Answer: C,E

Explanation:

On Cisco Catalyst 8000 Series Edge platforms, removing the chassis cover provides access to internal components such as DIMMs (Dual In-line Memory Modules) and SSDs (Solid-State Drives). These components are located internally and require the removal of the chassis cover for maintenance or replacement.

* DIMMs are used for system memory and are essential for the router's operation.

* SSDs provide storage for system software and configurations.

Other components like Network Interface Modules (NIMs) and transceivers are typically accessible externally and do not require chassis cover removal.

NEW QUESTION # 54

A technician must quickly identify multiple Cisco switches in a rack without powering them on. Where should the technician look for serial numbers on the device?

- A. Rear panel near the power supplies
- B. Bottom surface of each switch
- C. Top surface of each switch
- D. Front panel near the status LEDs

Answer: A

Explanation:

The serial number for Cisco switches is typically found on a label located on the rear panel near the power supplies. This positioning allows technicians to quickly access identification information even when the device is not powered on.

This label is essential for inventory tracking, RMA procedures, and registration for support. Serial numbers are not typically placed on the top or bottom surfaces for devices mounted in a rack, as those areas are less accessible.
