Download our updated and real ServiceNow questions right away rather than delaying.

ServiceNow Certified Implementation Specialist - Platform Analytics Sample Questions (Q44-Q49):

NEW QUESTION # 44

What configuration setting should be used to run a Historical Collection Job?

- A. Monthly
- B. Weekly
- C. Once or On Demand
- D. Daily

Answer: C

Explanation:

A Historical Collection Job is designed to collect past data for a defined historical period and is typically executed on demand. Unlike scheduled collection jobs (daily, weekly, or monthly), historical jobs are not intended to run repeatedly. ServiceNow documentation specifies that historical collections are initiated manually to backfill data for indicators that were created after records already existed. Running them on a recurring schedule could lead to duplicated or incorrect data. Therefore, the correct configuration is Once or On Demand, making option C the correct answer.

NEW QUESTION # 45

Which application helps to obtain insights on new and returning platform users and their navigation patterns?

- A. Responsive Dashboards
- B. Platform Analytics Workspace
- C. Next Experience Dashboards
- D. User Experience Analytics

Answer: D

Explanation:

User Experience Analytics is the application designed to analyze user behavior, including new versus returning users, session frequency, navigation paths, page views, and interaction patterns across the ServiceNow platform. It provides insights into how users engage with the platform and helps organizations optimize usability, adoption, and performance. Responsive Dashboards and Next Experience Dashboards are visualization and UI frameworks, not behavioral analytics tools. Platform Analytics Workspace focuses on KPI monitoring and process performance, not clickstream or navigation behavior. ServiceNow documentation clearly positions User Experience Analytics as the solution for understanding how users interact with the platform, making option D the correct answer.

NEW QUESTION # 46

What is the default Access Control for a new Indicator?

- A. Visible to Everyone, Visible by All Roles is False, role required is pa_admin
- B. Visible to Just Me, Visible by All Roles is False, role required is pa_admin
- C. Visible to Everyone, Visible by All Roles is True
- D. Visible to Just Me, Visible by All Roles is False

Answer: D

Explanation:

By default, a newly created Platform Analytics indicator is Visible to Just Me, and Visible by All Roles is set to False. This ensures that indicators are private to their creator until explicitly shared.

No role is required by default, and visibility must be intentionally expanded by updating the access control settings. This design supports governance and prevents incomplete or experimental indicators from being exposed prematurely. ServiceNow documentation confirms this default behavior, making option A the correct answer.

NEW QUESTION # 47

Which of the following statements best describes an Automated Indicator?

- A. A scheduled job that collects data
- **B. A series of measurements that describe a process over a period of time**
- C. A process summary taken at a single point in time
- D. A subcategorization of an indicator that provides more granular views of scores

Answer: B

Explanation:

An Automated Indicator in Platform Analytics is defined as a series of measurements collected over time that represent the performance of a process. These measurements are stored as time series data, allowing organizations to analyze trends, patterns, and historical performance. Automated indicators rely on indicator sources and scheduled data collection jobs to collect data at defined intervals, such as daily or hourly.

Option B describes a snapshot report, which represents data at a single point in time and does not support trending. Option C refers to breakdowns, which categorize indicator scores for deeper analysis but do not define the indicator itself. Option D describes the data collection job, which is a mechanism used by automated indicators but not the indicator definition. ServiceNow documentation explicitly states that indicators represent performance over time, making option A the correct and most complete description of an Automated Indicator.

NEW QUESTION # 48

How can a Breakdown be applied to multiple Indicators based on different Facts tables?

- A. Create a mapping script to define the relationship between the indicator facts tables and the breakdown source
- B. Configure the indicators to use the same indicator source
- C. Create a separate breakdown record for each indicator facts table
- **D. Create a separate breakdown mapping for each indicator facts table**

Answer: D

Explanation:

A single Breakdown can be reused across multiple indicators—even when those indicators are based on different facts tables—by creating a separate Breakdown Mapping for each indicator facts table.

The Breakdown defines what is being analyzed, while the Breakdown Mapping defines how the indicator facts relate to the breakdown source. Because different facts tables may store data differently, each requires its own mapping configuration. A scripted mapping is only required when no direct relationship exists, not simply because facts tables differ. ServiceNow documentation clearly states that reuse across facts tables is achieved through multiple mappings, making option D the correct answer.

NEW QUESTION # 49
