## Amazon AWS Certified Developer - Associate Sample Questions (Q109-Q114):

### NEW QUESTION # 109

A developer manages three AWS accounts. Each account contains an Amazon RDS DB instance in a private subnet. The developer needs to define users in each database in a consistent way.

The developer must ensure that the same users are created and updated later in all three accounts.

Which solution will meet these requirements with the MOST operational efficiency?

- A. Create an AWS CloudFormation template that contains a custom resource to create the users in the database. Deploy the template in each account.
- B. Create an AWS CloudFormation template. Declare the users in the template. Attach the users to the database. Deploy the template in each account.
- C. Write a script that creates the users. Deploy an Amazon EC2 instance in each account to run the script on the databases. Run the script in each account.
- D. Implement an AWS Lambda function that creates the users in the database. Provide the function with the details of all three accounts.

**Answer: A**

#### NEW QUESTION # 110

A developer is automating a new application deployment with AWS SAM. The new application has one AWS Lambda function and one Amazon S3 bucket. The Lambda function must access the S3 bucket to only read objects. How should the developer configure AWS SAM to grant the necessary read permission to the S3 bucket?

- A. Add a custom S3 bucket policy to the Lambda function.
- B. Reference a second Lambda authorizer function.
- C. Add the S3ReadPolicy template to the Lambda function's execution role.
- D. Create an Amazon SQS topic for only S3 object reads. Reference the topic in the template.

**Answer: C**

Explanation:

In AWS SAM, adding the S3ReadPolicy managed policy to the Lambda function's execution role grants the function read-only access to specified S3 buckets. This provides the necessary permissions to read objects securely and with minimal configuration.

#### NEW QUESTION # 111

A company is planning to use AWS CodeDeploy to deploy an application to Amazon Elastic Container Service (Amazon ECS). During the deployment of a new version of the application, the company initially must expose only 10% of live traffic to the new version of the deployed application. Then, after 15 minutes elapse, the company must route all the remaining live traffic to the new version of the deployed application.

Which CodeDeploy predefined configuration will meet these requirements?

- A. CodeDeployDefault ECSLinear10PercentEvery1 Minutes
- B. CodeDeployDefault ECSCanary10Percent15Minutes
- C. CodeDeployDefault LambdaCanary10Percent5Minutes
- D. CodeDeployDefault LambdaCanary10Percent15Minutes

**Answer: B**

Explanation:

\* CodeDeploy Predefined Configurations: CodeDeploy offers built-in deployment configurations for common scenarios.

\* Canary Deployment: Canary deployments gradually shift traffic to a new version, ideal for controlled rollouts like this requirement.

\* CodeDeployDefault.ECSCanary10Percent15Minutes: This configuration matches the company's requirements, shifting 10% of traffic initially and then completing the rollout after 15 minutes.

#### NEW QUESTION # 112

A developer wants to add request validation to a production environment Amazon API Gateway API. The developer needs to test the changes before the API is deployed to the production environment. For the test, the developer will send test requests to the API through a testing tool.

Which solution will meet these requirements with the LEAST operational overhead?

- A. Create a new API. Add the necessary resources and methods, including new request validation. Perform the tests. Modify the existing API to add request validation. Deploy the existing API to production.

- B. Modify the existing API to add request validation. Deploy the updated API to a new API Gateway stage. Perform the tests. Deploy the updated API to the API Gateway production stage.
- C. Clone the existing API. Modify the new API to add request validation. Perform the tests. Modify the existing API to add request validation. Deploy the existing API to production.
- D. Export the existing API to an OpenAPI file. Create a new API. Import the OpenAPI file. Modify the new API to add request validation. Perform the tests. Modify the existing API to add request validation. Deploy the existing API to production.

**Answer: B**

Explanation:

Amazon API Gateway allows you to create, deploy, and manage a RESTful API to expose backend HTTP endpoints, AWS Lambda functions, or other AWS services<sup>1</sup>. You can use API Gateway to perform basic validation of an API request before proceeding with the integration request<sup>1</sup>. When the validation fails, API Gateway immediately fails the request, returns a 400 error response to the caller, and publishes the validation results in CloudWatch Logs<sup>1</sup>.

To test changes before deploying to a production environment, you can modify the existing API to add request validation and deploy the updated API to a new API Gateway stage<sup>1</sup>. This allows you to perform tests without affecting the production environment.

Once testing is complete and successful, you can then deploy the updated API to the API Gateway production stage<sup>1</sup>.

This approach has the least operational overhead as it avoids unnecessary creation of new APIs or exporting and importing of APIs. It leverages the existing infrastructure and only requires changes in the configuration of the existing API<sup>1</sup>.

### NEW QUESTION # 113

An Amazon Simple Queue Service (Amazon SQS) queue serves as an event source for an AWS Lambda function. In the SQS queue, each item corresponds to a video file that the Lambda function must convert to a smaller resolution. The Lambda function is timing out on longer video files, but the Lambda function's timeout is already configured to its maximum value. What should a developer do to avoid the timeouts without additional code changes?

- A. Increase the visibility timeout on the SQS queue
- B. Use multi-threading for the conversion.
- C. Increase the memory configuration of the Lambda function
- D. Increase the instance size of the host that runs the Lambda function.

**Answer: C**

Explanation:

Explanation

Increasing the memory configuration of the Lambda function will also increase the CPU and network throughput available to the function. This can improve the performance of the video conversion process and reduce the execution time of the function. This solution does not require any code changes or additional resources. It is also recommended to follow the best practices for preventing Lambda function timeouts<sup>1</sup>. References
