2026 220-1201 Examcollection Dumps Torrent Free PDF | Efficient 220-1201 Exam Question: CompTIA A+ Certification Exam: Core 1

Hundreds of candidates want to get the CompTIA A+ Certification Exam: Core 1 (220-1201) certification exam because it helps them in accelerating their CompTIA careers. Cracking the 220-1201 exam of this credential is vital when it comes to the up gradation of their resume. The 220-1201 Certification Exam helps students earn from online work and it also benefits them in order to get a job in any good tech company.

CompTIA A+ Certification Exam: Core 1 Sample Questions (Q171-Q176):

NEW QUESTION # 171

Which of the following is an example of VDI?

- A. Provisioning a sandbox as a test environment
- B. Providing high-performance workstations with a local OS
- C. Launching a virtual machine server on a hypervisor
- D. Streaming a GUI to thin clients from a server

Answer: D

Explanation:

Virtual Desktop Infrastructure (VDI) delivers a desktop operating system hosted on a centralized server and streams the graphical user interface (GUI) to endpoint devices such as thin clients, zero clients, or standard PCs. According to CompTIA Core 1 (220-1201) virtualization objectives, VDI allows users to access their desktop environments remotely while all processing and data remain on the server.

Option A accurately describes this model: a GUI streamed from a server to thin clients. This approach improves centralized management, enhances security, and simplifies endpoint hardware requirements.

Provisioning a sandbox is an example of test or development virtualization, not desktop virtualization. High-performance workstations with a local OS are physical desktops, not VDI. Launching a virtual machine server on a hypervisor describes server virtualization, not desktop delivery.

CompTIA highlights VDI as a common enterprise solution that separates the desktop environment from the physical device, enabling flexibility, scalability, and centralized control.

NEW QUESTION # 172

Which of the following is a Bluetooth network an example of?

- A. PAN
- B. WAN
- C. LAN
- D. SAN

Answer: A

Explanation:

Bluetooth is a wireless technology designed for short-range communication between devices. It is a classic example of a Personal Area Network (PAN), which supports communication between devices like smartphones, headsets, keyboards, and mice within a few meters. PANs are smaller in scope compared to LANs or WANs.

NEW QUESTION # 173

Which of the following has the best penetration through physical objects, such as walls?

- A. 2.4GHz
- B. 5GHz
- C. NFC
- D. 6GHz

Answer: A

Explanation:

2.4GHz Wi-Fi signals have better penetration through walls and other obstacles compared to 5GHz and 6GHz. Lower frequency waves (like 2.4GHz) travel farther and are less absorbed by physical barriers.

From the CompTIA A+ 220-1101 Official Study Guide, Objective 2.5 - Compare and contrast wireless networking protocols:

"The 2.4GHz frequency band offers greater range and better penetration through walls and obstacles than higher frequencies like 5GHz and 6GHz. Higher frequencies provide faster speeds but are more easily absorbed by walls." NFC (Near Field Communication) is not a Wi-Fi technology and works only over very short distances (a few centimeters).

NEW QUESTION # 174

Which internet connection type will most likely experience interference from rain?

- A. Satellite
- B. Cable
- C. Fiber
- D. DSL

Answer: A

Explanation:

CompTIA A+ identifies satellite internet as the connection type most susceptible to weather-related interference, particularly rain, snow, and heavy cloud cover. This phenomenon is known as rain fade.

Satellite connections rely on high-frequency microwave signals transmitted between a dish antenna at the customer site and an orbiting satellite. Moisture in the atmosphere absorbs and scatters these signals, causing latency spikes, reduced bandwidth, or complete signal loss during storms.

Fiber (A) uses light signals through glass fiber and is immune to electromagnetic and weather interference.

Cable internet (B) uses shielded coaxial lines buried or run overhead, but rain does not affect signal quality in normal conditions.

DSL (D) uses telephone lines, which may degrade with physical line issues, but not directly due to rain in the same way satellite is affected.

Thus, satellite internet is most likely to experience signal degradation during rain conditions.

NEW QUESTION # 175

A user is having trouble with the location services on their smartphone. Location-based applications show incorrect positions when the user is traveling. This issue affects the user's ability to navigate and use location-dependent applications. Which of the following is the best way to resolve this issue?

- A. Downloading a third-party mapping application
- B. Restarting the smartphone
- C. Enabling Wi-Fi to assist GPS
- D. Resetting the network settings

Answer: C

Explanation:

Wi-Fi assistance in mobile devices helps improve location accuracy by using nearby wireless networks to triangulate the device's position, even when GPS signals are weak (like indoors or in dense areas).
