Juniper Data Center, Associate (JNCIA-DC) Sample Questions (Q177-Q182):

NEW QUESTION # 177
Which statement is correct about an IRB interface?

- A. An IRB interface is a physical Layer 3 interface that connects VLANs together.
- B. An IRB interface trunks together VLANs on different switches.
- C. An IRB interface is a Layer 3 interface that can be used to route between VLANs.
- D. An IRB interface switches traffic within the same VLAN.

Answer: C

Explanation:
An IRB (Integrated Routing and Bridging) interface provides routing functionality between VLANs at Layer 3, allowing devices in different VLANs to communicate with each other.
Step-by-Step Breakdown:
IRB Functionality:
The IRB interface enables routing between different VLANs by acting as a Layer 3 gateway. Traffic within the same VLAN is handled by Layer 2 switching, while traffic between VLANs is routed through the IRB interface.
Layer 3 Routing Between VLANs:
Each VLAN can be assigned an IP address on the IRB interface, which allows traffic to flow between VLANs based on Layer 3 IP routing.
Juniper Reference:
IRB Interface Configuration: Juniper supports IRB for inter-VLAN routing on devices like the EX and QFX series switches, facilitating Layer 3 communication in data centers.

NEW QUESTION # 178
Referring to the exhibit, which two statements are correct about the IP fabric? (Choose two.)

- A. Only traffic between pods must traverse the super spine devices.
- B. This is a five-stage fabric.
- C. This is a three-stage IP fabric.
- D. All traffic must traverse the super spine devices.

Answer: A,B

NEW QUESTION # 179
When evaluating BGP routes, what will be evaluated first?

- A. The MED value
- B. The origin value
- C. The local preference value
- D. The AS path

Answer: C

Explanation:
In BGP (Border Gateway Protocol), when evaluating multiple routes to the same destination, the first attribute that is considered is the local preference value. The local preference is a BGP attribute used to influence outbound routing decisions within an Autonomous System (AS).
Step-by-Step Breakdown:
Local Preference:

The local preference attribute is used to determine which path is preferred for traffic leaving the AS. The higher the local preference value, the more preferred the route.
BGP Path Selection:
The BGP path selection process evaluates the following attributes in this order:
Local Preference (higher is preferred)
AS Path (shorter is preferred)
Origin (IGP > EGP > incomplete)
MED (Multi-Exit Discriminator) (lower is preferred)
Juniper Reference:
BGP Path Selection: In Junos, the local preference attribute is the first to be evaluated when determining the best path for outbound traffic.

NEW QUESTION # 180
Which two statements are correct about EVPN-VXLAN overlay networking? (Choose two.)

- A. An encapsulation of the original packet is required to transport the packet across the network.
- B. It is the only option to provide reachability between servers that reside in the same network segment in a data center.
- C. OSPF provides the control plane within the overlay network.
- D. BGP provides the control plane within the overlay network.

Answer: A,D

Explanation:
EVPN-VXLAN is an overlay technology used in data center networks to extend Layer 2 services over a Layer 3 network.
Step-by-Step Breakdown:
BGP Control Plane:
BGP (Border Gateway Protocol) is used as the control plane for EVPN-VXLAN. BGP advertises MAC addresses and IP address reachability information across the VXLAN network, enabling efficient multi-tenant Layer 2 connectivity over a Layer 3 infrastructure.
Encapsulation:
VXLAN (Virtual Extensible LAN) encapsulates Layer 2 frames into Layer 3 packets. This encapsulation allows Layer 2 traffic to be transported across a Layer 3 network, effectively creating a tunnel for Ethernet frames.
Juniper
Reference: EVPN-VXLAN Configuration: Juniper supports EVPN-VXLAN with BGP as the control plane, allowing scalable Layer 2 connectivity over a routed infrastructure in modern data centers.

NEW QUESTION # 181
How can OSPF be configured to prefer one route over another?

- A. By configuring route redistribution.
- B. By setting a higher cost on the preferred route.
- C. By setting a lower cost on the preferred route.
- D. By adjusting interface bandwidth.

Answer: C
