Salesforce Certified Platform Developer II - Multiple Choice Sample Questions (Q40-Q45):

NEW QUESTION # 40

Universal Containers is leading a development team that follows the source-driven development approach in Salesforce. As part of their continuous integration and delivery (CI/CD) process, they need to automatically deploy changes to multiple environments, including sandbox and production.

Which mechanism or tool would best support their CI/CD pipeline in source-driven development?

- A. Salesforce Extensions for Visual Studio Code
- B. Ant Migration Tool
- C. Change Sets
- **D. Salesforce CLI with Salesforce DX**

Answer: D

Explanation:

Salesforce CLI with Salesforce DX supports source-driven development and is designed for continuous integration and delivery (CI/CD) processes. It enables developers to automate deployments across multiple environments, including sandbox and production.

NEW QUESTION # 41

A user receives the generic "An internal server error has occurred" while interacting with a custom Lightning component. What should the developer do to ensure a more meaningful message?

- A. Add an onerror event handler to the tag.
- B. Use platform events to process the error
- C. Add an error-view component to the markup.

- D. Use an AuraHandledException in a try-catch block.

Answer: D

Explanation:

Use AuraHandledException in try-catch for custom errors. It enables sending meaningful, user-friendly error messages to the Lightning component.

NEW QUESTION # 42

A company wants to incorporate a third-party web service to set the Address fields when an Account is inserted, if they have not already been set.

What is the optimal way to achieve this?

- A. Create a Before Save Flow, execute a Queueable job from it, and make a callout from the Queueable job.
- B. Create a Process, execute a Queueable job from it, and make a callout from the Queueable job.
- C. Create an Apex trigger, execute a Queueable job from it, and make a callout from the Queueable job.
- D. Create a Workflow Rule, execute a Queueable job from it, and make a callout from the Queueable job.

Answer: C

Explanation:

To make a callout to set the Address fields when an Account is inserted without violating the Salesforce limit against callouts from triggers, a developer can use a trigger to execute a Queueable job. The Queueable job can then safely make the callout.

NEW QUESTION # 43

A developer is developing a reusable Aura component that will reside on an sObject Lightning page with the following HTML snippet:

```
<aura:component implements="force:hasRecordId,force:availableForAllPageTypes">
  <div>Hello!</div>
</aura:component>
```

How can the component's controller get the context of the Lightning page that the sObject is on without requiring additional test coverage?

- A. Add force:hasSubjectName to the implements attribute.
- B. Use the getSubjectType method in an Apex class.
- C. Create a design attribute and configure via App Builder.
- D. Set the sObject type as a component attribute.

Answer: A

Explanation:

By implementing force:hasSubjectName, the Aura component can retrieve the sObject context of the record page it is placed on without needing additional information. This interface provides the component with the API name of the sObject being displayed. Aura Components Developer Guide
