EMC Dell Information Storage and Management Foundations v2 Exam Sample Questions (Q54-Q59):

NEW QUESTION # 54

Question:

An organization needs to adhere to compliance and lower the cost of the primary storage. What process should they implement?

- A. Data compression
- B. Data encryption
- C. Data backup
- D. Data archiving

Answer: D

Explanation:

Data archiving involves moving infrequently accessed data to a separate storage system, freeing up space on primary storage and reducing costs. It also aids in compliance by retaining data for specified periods, as required by various regulations.

* Data backup: Creates copies of data for recovery purposes but doesn't necessarily reduce primary storage usage.
* Data archiving: Moves less frequently accessed data to cost-effective storage, aiding compliance and reducing primary storage costs.
* Data encryption: Secures data but doesn't impact storage costs or compliance retention.
* Data compression: Reduces data size but may not meet compliance requirements for data retention.

NEW QUESTION # 55

Question:

Which layer of the OSI reference model provides logical end-to-end connections, sequencing, and integrity?

- A. Presentation
- **B. Transport**
- C. Data Link
- D. Session

Answer: B

Explanation:

The Transport layer (Layer 4) of the OSI model ensures reliable data transfer between systems by providing:

End-to-end connections- manages communication sessions

Sequencing- orders data packets

Integrity- error detection and correction

* Session (Layer 5): Manages sessions and controls dialogues between systems.

* Data Link (Layer 2): Deals with local network frame delivery.

* Presentation (Layer 6): Translates data formats (like encryption, compression).

NEW QUESTION # 56

Question:

In traditional provisioning, which two factors determine the availability, capacity, and performance of the RAID set?

- **A. The RAID level**
- **B. The number of drives in the RAID set**
- C. Make of drives
- D. Capacity of drives

Answer: A,B

Explanation:

In traditional storage provisioning, the RAID configuration significantly impacts the storage system's characteristics:

* RAID Level: Determines data redundancy and fault tolerance. For example, RAID 1 mirrors data, providing high availability, while RAID 5 uses parity, balancing performance and redundancy.

* Number of Drives: Affects both capacity and performance. More drives can increase total storage capacity and improve performance through parallel data access.

* Make of Drives: While drive quality matters, it's less influential than RAID configuration in determining overall system characteristics.

* Capacity of Drives: Impacts total storage size but doesn't directly influence performance or availability as significantly as RAID level and drive count.

NEW QUESTION # 57

Question:

An Ethernet switch has eight ports, and all ports must be operational for 24 hours from Monday through Friday. However, failures of Port 6 occur within the week as follows:

- * Tuesday: 6 AM to 8 AM
- * Thursday: 5 PM to 10 PM
- * Friday: 7 AM to 9 AM What is the MTBF (Mean Time Between Failures) of Port 6?

- A. 30 hours
- **B. 40 hours**
- C. 37 hours
- D. 32 hours

Answer: B

Explanation:

To calculate the MTBF, we need to determine the total operational time and the number of failures.

* Total operational time (Monday to Friday): 5 days \times 24 hours = 120 hours

* Number of failures: 3 (Tuesday, Thursday, Friday)

MTBF = Total operational time / Number of failures

MTBF = 120 hours / 3 = 40 hours

NEW QUESTION # 58

Question:

How does Storage Class Memory (SCM) compare to DRAM and flash memory in terms of speed?

- **A. SCM is slower than DRAM but faster than flash**
- B. SCM is slower than flash but faster than HDDs
- C. SCM is faster than both DRAM and flash
- D. SCM is as fast as DRAM

Answer: A

Explanation:

Storage Class Memory (SCM) bridges the gap between DRAM and NAND flash memory. It offers faster access times than flash memory but is still slower than DRAM. SCM provides non-volatile storage with performance characteristics closer to DRAM, making it suitable for applications requiring high-speed data access.
