Well-Prepared Valid Exam ACD201 Vce Free & Professional Standard ACD201 Answers & Excellent New ACD201 Test Pass4sure

When you are struggling with those troublesome reference books; when you feel helpless to be productive during the process of preparing different exams (such as ACD201 exam); when you have difficulty in making full use of your sporadic time and avoiding procrastination. It is time for you to realize the importance of our ACD201 Test Prep, which can help you solve these annoyance and obtain a ACD201 certificate in a more efficient and productive way. As long as you study with our ACD201 exam questions for 20 to 30 hours, you will be confident to take and pass the ACD201 exam for sure.

Appian Senior Developer Sample Questions (Q37-Q42):

NEW QUESTION # 37

You're creating a point-of-sale (POS) system for a customer which can associate the items in a transaction to a customer based on a membership number. The item stock table and the customer sales record are hosted elsewhere and need to be written to via POST APIs from an Appian process model. This all occurs within a transaction process model that you're creating.

Which two steps should you perform to design your process model to improve process memory? (Choose two.)

- A. Add a terminate process node to the end of the process.
- B. Create the two POST APIs as asynchronous subprocesses.
- C. Ensure that the entire process is activity-chained so that the person entering the transaction knows when the process is completed.
- D. Create the two POST APIs as synchronous subprocesses.

Answer: A,B

Explanation:

Creating the POST API calls as asynchronous subprocesses allows them to run independently, reducing memory usage in the main process.

Adding a terminate process node at the end ensures the process completes and releases memory as soon as its work is finished.

NEW QUESTION # 38

You run a report on different employee transactions by using a View.

You encounter the following error: "a!queryEntity: An error occurred while retrieving the data." What is the most likely root cause of this error?

- A. The rule contains a missing syntax.
- B. The view doesn't have a column mapped as a primary key in its corresponding CDT.
- C. The view contains a large number of rows, requiring more time to fetch the data.

Answer: B

Explanation:

The most likely root cause is that the view doesn't have a column mapped as a primary key in its corresponding CDT. Appian requires a primary key mapping for querying views to ensure data integrity and identification.

NEW QUESTION # 39

A view is created with the primary table PERSON and is joined using a left join with the APPOINTMENT table on the column "PERSON_ID". There is a one-to-many relationship between the PERSON and APPOINTMENT tables.

A Custom Data Type (CDT) and a data store entity have been created based on this view, with the primary key being "PERSON_ID".

Review the data presented in the PERSON and APPOINTMENT tables:

Which two statements are true when the following query entity is executed? (Choose two.)

- A. Appian makes one more query to the database (other than the actual query to fetch the data) to get the totalCount based on the applied filters.
- B. Appian makes one more query to the database (other than the actual query to fetch the data) to get the totalCount based on the applied filters and paging info.
- C. result totalCount is 1
- D. result totalCount is 3

Answer: A,C

Explanation:

Appian makes an additional query to the database (other than the main query for data) to retrieve the totalCount when fetchTotalCount: true() is used.

The result totalCount is 1, as there is only one person (PERSON_ID 1101) being filtered, even though there are multiple "New" appointments for that person; with a CDT based on PERSON_ID as the primary key, only one row is counted per person.

NEW QUESTION # 40

You need to display information for pending tasks for each individual in an application. The tasks may be for a single specific application.

Which context type should you select for the Task Report Type?

- A. Tasks by process model
- B. Tasks attributed to user
B Tasks by process

Answer: B

Explanation:

"Tasks attributed to user" is the correct context type, as it allows you to display pending tasks assigned to each individual in the application.

NEW QUESTION # 41

Consider this POST request:

`https://www.example.com/suite/webapi/customer`

Match the values to the correct fields in the resulting http!request value.

Note: Each value will be used once. To change your responses, you may deselect your response by clicking the blank space at the top of the selection list.

Answer:

Explanation:

NEW QUESTION # 42

.....

Our Appian ACD201 Practice Exam software is compatible with Windows computers. If you run into any issues while using our Appian Senior Developer (ACD201) exam simulation software, our 24/7 product support team is here to help you.
