Splunk Phantom Certified Admin Sample Questions (Q79-Q84):

NEW QUESTION # 79

Which of the following is the complete list of the types of backups that are supported by Phantom?

- A. Full, delta, and incremental backups.
- **B. Full and incremental backups.**
- C. Full and delta backups.
- D. Full backups.

Answer: B

NEW QUESTION # 80

Which of the following can be configured in the ROI Settings?

- A. Time lost.
- B. Analyst hours per month.
- **C. Number of full time employees (FTEs).**
- D. Annual analyst salary.

Answer: C

Explanation:

The ROI (Return on Investment) Settings within Splunk SOAR are designed to help organizations assess the value derived from their use of the platform, particularly in terms of resource allocation and efficiency gains.

The setting mentioned in the question, "Number of full time employees (FTEs)," relates directly to measuring this efficiency.

Answer "C" is correct because configuring the number of full-time employees (FTEs) in the ROI settings allows an organization to input and monitor how many personnel are dedicated to security operations managed through SOAR. This setting is crucial for calculating the labor cost associated with incident response and routine security tasks. By understanding the number of FTEs involved, organizations can better assess the labor cost savings provided by automation and orchestration in SOAR. This data helps in quantifying the operational efficiency and the overall impact of SOAR on resource optimization.

In contrast, other options like "Analyst hours per month," "Time lost," and "Annual analyst salary" might seem relevant but are not directly configurable within the ROI settings of Splunk SOAR. These aspects could be indirectly calculated or estimated based on the number of FTEs and other operational metrics but are not directly input as settings in the system.

This use of FTEs in ROI calculations is often discussed in materials related to cybersecurity efficiency metrics and SOAR platform utilization. Official Splunk documentation and best practices guides typically provide insights into how to set up and interpret ROI settings, highlighting the importance of accurate configuration for meaningful analytics.

NEW QUESTION # 81

Which of the following expressions will output debug information to the debug window in the Visual Playbook Editor?

- A. `phantom.exception()`
- B. `phantom.print ()`
- **C. `phantom.debug()`**
- D. `phantom.assert()`

Answer: C

Explanation:

The `phantom.debug()` function is used within Splunk SOAR playbooks to output debug information to the debug window in the Visual Playbook Editor. This function is instrumental in troubleshooting and developing playbooks, as it allows developers to print out variables, messages, or any relevant information that can help in understanding the flow of the playbook, the data being processed, and any issues that might arise during execution. This debugging tool is essential for ensuring that playbooks are functioning as intended and for diagnosing any problems that may occur.

NEW QUESTION # 82

Splunk user account(s) with which roles must be created to configure Phantom with an external Splunk Enterprise instance?

- A. `phantomsearch`, `phantomdelete`
- B. `admin`, `user`

- C. phantomcreate, phantomedit
- **D. superuser, administrator**

Answer: D

NEW QUESTION # 83

Which of the following applies to filter blocks?

- A. Can select containers by severity or status.
- **B. Can be used to select data for use by other blocks.**
- C. Can select assets by tenant, approver, or app.
- D. Can select which blocks have access to container data.

Answer: B

Explanation:

The correct answer is C because filter blocks can be used to select data for use by other blocks. Filter blocks can filter data from the container, artifacts, or custom lists based on various criteria, such as field name, value, operator, etc. Filter blocks can also join data from multiple sources using the join action. The output of the filter block can be used as input for other blocks, such as decision, format, prompt, etc. See Splunk SOAR Documentation for more details.

Filter blocks within Splunk SOAR playbooks are designed to sift through data and select specific pieces of information based on defined criteria. These blocks are crucial for narrowing down the data that subsequent blocks in a playbook will act upon. By applying filters, a playbook can focus on relevant data, thereby enhancing efficiency and ensuring that actions are taken based on precise, contextually relevant information.

This capability is essential for tailoring the playbook's actions to the specific needs of the incident or workflow, enabling more targeted and effective automation strategies. Filters do not directly select blocks for container data access, choose assets by various administrative criteria, or select containers by attributes like severity or status; their primary function is to refine data within the playbook's operational context.
