### 問題 #36

Which programming software task is well-suited for artificial intelligence?

- A. Adding comments to scripts
- B. Specifying project structure
- C. Performing user testing
- **D. Suggesting code modifications**

答案： D

解題說明：

Artificial Intelligence, particularly Large Language Models (LLMs) trained on vast repositories of public code, has become exceptionally proficient at suggesting code modifications. This task is well-suited for AI because code is inherently structured and follows strict logical and syntactical rules. AI can analyze a snippet of code, identify inefficiencies, detect potential bugs, and suggest more "pythonic" or optimized ways to achieve the same result. This is often referred to as "AI-assisted development" or "copiloting." While AI can certainly add comments to scripts, that is a relatively low-level task compared to the complex logic involved in code modification. Specifying project structure and performing user testing often require a high-level architectural understanding and human-centric feedback that AI currently lacks in a holistic sense.

Suggesting modifications involves the AI "understanding" the intent of the code and predicting the next logical sequence or identifying a better algorithm to solve a problem. This capability significantly accelerates the development lifecycle, allowing developers to focus on high-level logic while the AI handles boilerplate code and optimization suggestions. It bridges the gap between raw intent and functional implementation by leveraging the statistical likelihood of code patterns found in high-quality software libraries.

### 問題 #37

What is an advantage of using Personas in prompt engineering?

- A. Greater response speed
- B. Better memory of past conversations
- **C. Highly relevant responses**
- D. Efficient use of system memory

答案： C

解題說明：

The primary advantage of using a persona (e.g., "Act as a senior data scientist" or "You are a friendly high school tutor") is the generation of highly relevant responses. A persona acts as a sophisticated filter for the AI's vast training data. When a persona is assigned, the model narrows its focus to the tone, vocabulary, and problem-solving frameworks that are most characteristic of that specific role. This ensures that the output is stylistically and substantively aligned with the user's expectations.

For instance, if you ask for financial advice without a persona, you may get a generic list of tips. If you use the persona of a "conservative financial planner for retirees," the response will prioritize low-risk investments and capital preservation. This relevance is key to professional applications where the "voice" of the output is just as important as the information itself. Personas essentially prime the model's "associative memory" to pull from the most appropriate clusters of data, making the interaction feel more like a consultation with an expert rather than a search query.

### 問題 #38

A team of historians wants to use AI-based tools to aid in the research of the history of Europe's agricultural equipment. What is the importance of writing effective prompts in the research?

- **A. It ensures that researchers remain focused.**
- B. It ensures that interpretations are innovative.
- C. It determines the level of importance of the research.
- D. It reduces the need for reliance on multiple sources.

答案： A

#### 解題說明:

In academic and historical research, the sheer volume of available data can easily lead to "scope creep" or tangential exploration. Writing effective prompts is crucial because it ensures that researchers remain focused on their specific inquiry. When dealing with a broad subject like "Europe's agricultural equipment," an unstructured prompt might return a generalized history of farming. However, an effective prompt-specifying the region (e.g., Western Europe), the era (e.g., the Industrial Revolution), and the specific type of equipment (e.g., steam-powered threshing machines)-acts as a navigational guide for the AI.

This focus is essential for maintaining the integrity of the research process. It prevents the AI from generating irrelevant "filler" content and forces the output to adhere to the specific historical parameters defined by the team. While AI can assist in synthesizing information, it cannot determine the "importance" of research (which is a human value judgment) nor should it replace the need for multiple sources (as verification is still required). By refining the prompt to include specific constraints and objectives, historians can use AI as a precision tool to uncover specific data points and trends, ensuring that the resulting analysis stays aligned with the original research goals.

#### 問題 #39

What is the importance of descriptive language when engineering a prompt for image creation?

- A. It prevents intellectual violations.
- B. It increases the speed of generation.
- C. It ensures that the AI uses true originality.
- **D. It helps the AI capture and create nuances.**

答案: D

#### 解題說明:

Descriptive language is the primary tool a prompt engineer uses to steer a model toward a specific aesthetic; its primary importance is that it helps the AI capture and create nuances. Image generation models (like Midjourney or DALL-E) are trained on vast datasets of images and their corresponding captions. When a user uses nuanced language-such as "dappled sunlight," "bristly texture," or "art nouveau style"-it prompts the AI to pull from very specific, high-resolution subsets of its training data. Simple prompts result in generic, "stock photo" style outputs. However, by adding descriptive layers regarding the medium (oil on canvas, 35mm film), the lighting (golden hour, volumetric fog), and the composition (wide-angle, macro), the user provides the model with the necessary "clues" to create a complex and emotionally resonant piece. Nuance is what separates a professional AI-generated asset from a casual one.

It allows for the subtle interplay of light and shadow or the specific "feel" of a historical era. While it doesn't guarantee "true originality" (as the AI is always interpolating from existing data), it significantly improves the fidelity and artistic value of the output by giving the model a precise blueprint for the subtle details that define a high-quality visual.

#### 問題 #40

Which task can be accomplished with the data cleaning capabilities of generative AI?

- **A. Identifying inaccuracies**
- B. Identifying underlying bias
- C. Drawing valid conclusions
- D. Reducing total volume

答案: A

#### 解題說明:

Generative AI models, specifically Large Language Models (LLMs), are highly effective at identifying inaccuracies within a dataset during the data cleaning phase. When provided with a dataset and a prompt to "check for consistency" or "identify anomalies," the AI can cross-reference the data points against its internal knowledge base or the logical rules established in the prompt. For example, if a list of "US States" includes "London," the AI can flag this as an inaccuracy.

This capability extends to identifying spelling errors, formatting inconsistencies (e.g., dates written in multiple formats), and logical contradictions. While AI can help in identifying bias (Option D), that is usually considered a higher-level "auditing" task rather than a standard "cleaning" task. Identifying inaccuracies is a foundational step in the data pipeline; by cleaning the data first, the user ensures that any subsequent analysis or "conclusion drawing" (Option C) is based on high-quality, reliable information. In prompt engineering, this is often performed using the "Self-Correction" or "Reviewer" pattern, where one prompt generates data and a second prompt is used specifically to identify and fix any factual or structural inaccuracies within that output.
