## Updated ISA Questions Ensure Thorough ISA-IEC-62443 Exam Preparation

Of course, the future is full of unknowns and challenges for everyone. Even so, we all hope that we can have a bright future. Pass the ISA-IEC-62443 exam, for most people, is an ability to live the life they want, and the realization of these goals needs to be established on a good basis of having a good job. A good job requires a certain amount of competence, and the most intuitive way to measure competence is whether you get a series of the test ISA certification and obtain enough qualifications. With the qualification certificate, you are qualified to do this professional job. Therefore, getting the test ISA certification is of vital importance to our future employment. And the ISA-IEC-62443 Study Materials can provide a good learning platform for users who want to get the test ISA certification in a short time.

## ISA/IEC 62443 Cybersecurity Fundamentals Specialist Sample Questions (Q119-Q124):

### NEW QUESTION # 119

Why is OPC Classic considered firewall unfriendly?

- A. It dynamically assigns several ports.
- B. It works with control devices from different manufacturers.
- C. It allows use of only port 80.
- D. It is an obsolete communication standard.

**Answer: A**

Explanation:

OPC Classic uses Microsoft's DCOM (Distributed Component Object Model) for communication, which dynamically opens

multiple ports, making it extremely difficult to manage with firewalls.

"OPC Classic is firewall-unfriendly because DCOM requires dynamic port negotiation, making it difficult to define consistent firewall rules."

- ISA/IEC 62443-3-3:2013, Annex A - Communication Protocols and Security Concerns This lack of port predictability presents a significant security and operational risk, which led to the development of OPC UA, which uses fixed ports and supports encryption.

### NEW QUESTION # 120

Which characteristic is MOST closely associated with the deployment of a demilitarized zone (DMZ)?

Available Choices (select all choices that are correct)

- A. Internet access through the firewall is allowed.
- B. Level 4 systems must use the DMZ to communicate with Level 3 and below.
- C. Email is prevented, thereby mitigating the risk of phishing attempts.
- D. Level 0 can only interact with Level 1 through the firewall.

**Answer: A**

Explanation:

In cybersecurity, a demilitarized zone (DMZ) refers to a physical or logical subnetwork that contains and exposes an organization's external-facing services to an untrusted network, typically the internet. The main characteristic of a DMZ is that it acts as a buffer zone between the public internet and the private network.

This allows for internet access through the firewall while keeping the internal network secure. Internet-facing servers are placed in the DMZ so that they are separated from the rest of the internal network. By doing so, if a server in the DMZ is compromised, the attacker would not have direct access to the internal network. This architecture is commonly used to host services such as web servers, mail servers, and FTP servers. Choice C is the most closely associated with the deployment of a DMZ as it allows for regulated and monitored internet access through a firewall.

### NEW QUESTION # 121

Which statement BEST describes the Target Security Protection Ratings?

- A. They outline the desired levels of system security requirements to be fulfilled during operation.
- B. They define the levels of security requirements fulfilled through implementation measures.
- C. They represent the actual security levels achieved at a time during operation.
- D. They measure the cost-effectiveness of security investments or implementation measures.

**Answer: A**

Explanation:

In ISA/IEC 62443, Target Security Protection Ratings correspond to the concept of Target Security Levels (SL-T).

Step 1: Definition of target ratings

Target ratings describe the desired level of protection that a system or zone must achieve during operation, based on risk assessment.

Step 2: Difference between target and achieved

\* Target ratings define what is required.

\* Achieved ratings (SL-A) describe what has actually been implemented and verified.

Step 3: Why Option D is correct

The target rating outlines the intended security outcome that implementation measures must fulfill during operation, not what currently exists.

Step 4: Why other options are incorrect

Actual achieved levels, cost metrics, or implementation measurements are separate concepts.

Therefore, the correct description is that they outline the desired levels of system security requirements to be fulfilled during operation.

### NEW QUESTION # 122

What is a frequent mistake made with cybersecurity management?

- A. Implementing too many security practices at once
- B. Ignoring organizational culture
- **C. Focusing solely on technology solutions**
- D. Initially addressing smaller pieces of the entire system

**Answer: C**

Explanation:

One of the most frequent mistakes in cybersecurity management-according to ISA/IEC 62443 guidance-is focusing only on technological solutions and neglecting other critical components such as people, process, and culture. Effective cybersecurity management must include policies, training, incident response, and continual improvement, not just technical controls. This holistic approach is emphasized throughout the standards, particularly in the sections describing CSMS program elements and organizational responsibilities.

Reference: ISA/IEC 62443-2-1:2009, Section 4.2.3 ("Cybersecurity is not just a technology problem!"); Section 6.2.4 (Organizational awareness and training).

### NEW QUESTION # 123

What is a key feature of the NIS2 Directive?

- A. It focuses solely on physical security regulations.
- B. It mandates compliance with all standards.
- C. It eliminates the need for public-private partnerships.
- **D. It establishes a cyber crisis management structure.**

**Answer: D**

Explanation:

The NIS2 Directive, an update to the European Union's cybersecurity directive, introduces several new requirements, including the establishment of a cyber crisis management framework at both national and EU levels. This is designed to coordinate effective responses to major cybersecurity incidents and crises. NIS2 goes beyond mandating compliance or focusing only on physical security and emphasizes collaboration between the public and private sectors.
