In order to meet the demand of all customers and protect your machines network security, our company can promise that our 3V0-21.23 study materials have adopted technological and other necessary measures to ensure the security of personal information they collect, and prevent information leaks, damage or loss. In addition, the 3V0-21.23 Study Materials system from our company can help all customers ward off network intrusion and attacks prevent information leakage, protect user machines network security.

VMware 3V0-21.23 Exam Syllabus Topics:

Topic	Details
Topic 1	IT Architectures, Technologies, Standards: This section of the exam measures the skills of IT Architects and covers differentiating between business and technical requirements, as well as conceptual, logical, and physical design. A key skill measured is "Designing System Availability."

Topic 2	VMware Products and Solutions: Targeting VMware Engineers, this section describes VMware Cloud Foundation architecture, its components like vSphere and NSX, benefits such as automation and scalability, and use cases like hybrid cloud environments. It assesses understanding of VMware Validated Solutions.
Topic 3	Plan and Design the VMware Solution: This part targets Solution Designers, evaluating their ability to gather business objectives, create conceptual models based on these objectives, develop logical designs, and translate them into physical designs that meet specific requirements like manageability or security.

Reliable VMware 3V0-21.23 Dumps Ppt - 3V0-21.23 Exam Online

The 3V0-21.23 web-based practice exam requires no installation so you can start your preparation instantly right after you purchase. With thousands of satisfied customers around the globe, questions of the VMware vSphere 8.x Advanced Design (3V0-21.23) exam dumps are real so you can pass the VMware vSphere 8.x Advanced Design (3V0-21.23) certification on the very first attempt. Hence, it reduces your chances of failure and you can save money and time as well. VMware exam questions come in three formats i.e., web-based practice test, desktop practice test software, and PDF dumps.

VMware vSphere 8.x Advanced Design Sample Questions (Q57-Q62):

NEW QUESTION # 57

An architect is designing a new greenfield environment with 600 ESXi hosts in an automated fashion. The engineering department already has a PXE Boot server, TFTP server, and DHCP server set up with an NFS mount for their current Linux servers. The architect must be able to demonstrate and meet a security requirement to have all infrastructure processes separated. Which recommendation should the architect make for the ESXi host deployment?

- A. Deploy each ESXi host individually and document it to satisfy security requirements
- B. Ask the business to expand the engineering environment to service the virtual environment as well
- C. Request a common shared network with flexible security measures to accommodate different auto deployment options
- D. Request an isolated network segment to use and dedicate it to Auto Deploy functions

Answer: D

Explanation:

You can greatly reduce the security risk of Auto Deploy by completely isolating the network where Auto Deploy is used.

NEW QUESTION # 58

An architect is creating the design for a vSphere platform that will be used as the target for a migration from multiple legacy vSphere platforms that are being decommissioned. The customer has provided the following information:

Each legacy platform has its own set of virtual machine templates stored in OVF format.

All of the templates need to be migrated to the new platform.

After migration, the templates should be centralized into a single location.

The templates must be accessible to all clusters in the new platform vCenter instance.

Any new templates added to the central location must be automatically available to all clusters.

Administrators must be able to deploy new virtual machines directly from the template instances.

The customer also confirmed that after the migrations are complete, the new platform will be the only vSphere solution available.

Which design choice should the architect evaluate in the logical design for the storage and management of virtual machine templates?

- A. Use a local content library
- B. Use a shared datastore on each vSphere cluster
- C. Use a dedicated datastore on each vSphere cluster
- D. Use a subscribed content library

Answer: D

Explanation:

A subscribed content library is the best design choice for managing and centralizing virtual machine templates in this scenario. Here's why:

Centralized Management: A subscribed content library allows templates to be stored in a central location and made available to all clusters within the vCenter instance. Any new templates added to the central content library are automatically made available to all subscribed clusters, meeting the requirement for templates to be centrally stored and easily accessible by all clusters.

Automatic Updates: When a new template is added to the central content library, it becomes automatically available to all clusters that subscribe to it, fulfilling the requirement for automatically available new templates.

VM Template Deployment: Administrators can deploy new virtual machines directly from the template instances stored in the content library, which ensures that the deployment process is streamlined and consistent.

NEW QUESTION # 59

What is the primary purpose of data protection requirements for a vSphere design?

- A. To determine the hardware specifications needed for the vSphere environment.
- **B. To ensure the confidentiality and security of sensitive data stored in the vSphere system.**
- C. To specify the expected levels of system performance and responsiveness.
- D. To identify the specific tasks and operations the vSphere system should perform.

Answer: B

NEW QUESTION # 60

An architect is tasked with designing the vSphere cluster layout for a customer. The customer is NOT sure how many clusters are required or the number of hosts to use in any of the clusters.

The customer has provided the following requirements:

- The placement of Linux and Windows machines (end user virtual machines) needs to be controlled for license compliance.
- Access to virtual machines such as Active Directory and DHCP (infrastructure virtual machines) should be restricted to just the platform administration team.
- Infrastructure virtual machines should not prevent end user virtual machines from consuming their allocated resources.
- Utilization for the current infrastructure's virtual machines is less than end user virtual machines.
- The platform needs to provide the ability to lifecycle manage the hosts without impacting end user virtual machines.
- The platform needs to account for the predicted future growth of end user virtual machines being very high, while for infrastructure virtual machines being very low.
- There are a total of 15 physical servers for use across the platform.

Which of the proposed cluster layouts would meet the customer's requirements?

- **A. One vSphere cluster of six hosts for Linux virtual machines, one vSphere cluster of six hosts for Windows virtual machines and one vSphere cluster of three hosts for infrastructure virtual machines.**
- B. One vSphere cluster of five hosts for Linux virtual machines, one vSphere cluster of five hosts for Windows virtual machines and one vSphere cluster of five hosts for infrastructure virtual machines.
- C. One vSphere cluster of 15 hosts for all virtual machines with resource controls to give higher priority to end user virtual machines.
- D. One vSphere cluster of 12 hosts for Linux and Windows virtual machines and one vSphere cluster of three hosts for infrastructure virtual machines.

Answer: A

NEW QUESTION # 61

What is the primary function of vCenter Server in a vSphere environment?

- A. To provide licensing for vSphere products
- B. To manage and secure the physical network infrastructure
- **C. To manage and monitor virtual machines and ESXi hosts**
- D. To provide a platform for virtual machine storage

Answer: C
