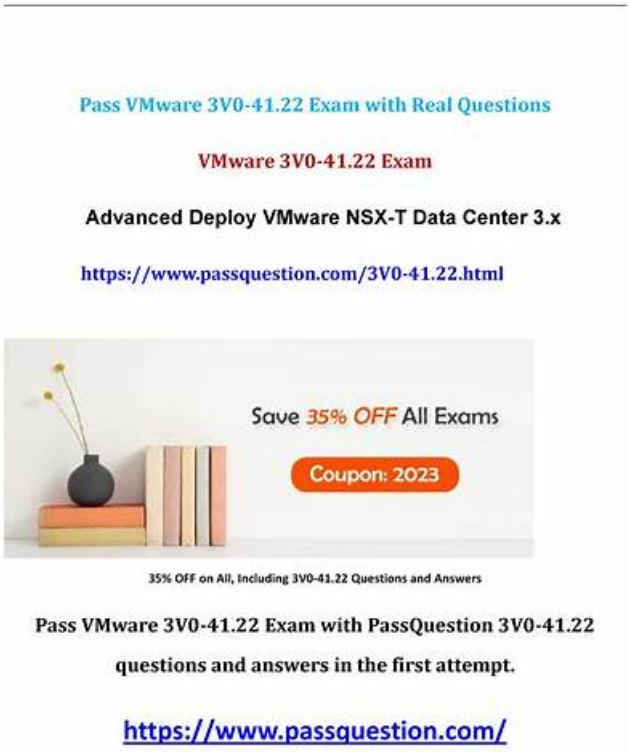
3V0-41.22 Praxisprüfung - 3V0-41.22 Pruefungssimulationen



Laden Sie die neuesten DeutschPrüfung 3V0-41.22 PDF-Versionen von Prüfungsfragen kostenlos von Google Drive herunter: https://drive.google.com/open?id=1GgBz_ock-RkhenNWIkHCOeWIPTe52-jI

Möchten Sie in kurzer Zeit die 3V0-41.22 VMware Zertifizierungsprüfung bestehen? Unser DeutschPrüfung bietet Ihnen die Testfragen und Antworten zur VMware 3V0-41.22 Zertifizierung, die von den IT-Experten durch Experimente und Praxis erhalten werden und über IT-Zertifizierungserfahrungen über 10 Jahre verfügt. Außerdem gewährt unser DeutschPrüfung Ihnen die vollständigsten Zertifizierungskriterien sowie Ausbildungsmethoden. Die Ergebnisse von unseren Kunden haben bewiesen, dass die Genauigkeit der VMware 3V0-41.22 Zertifizierung 100% beträgt! Wenn Sie irgendeine Frage über die 3V0-41.22 Prüfung haben, werden wir so schnell wie möglich beantworten.

Die VMware 3V0-41.22 Zertifizierungsprüfung ist darauf ausgelegt, das Wissen und die Fähigkeiten von Fachleuten zu testen, die für die Bereitstellung und Verwaltung von VMware NSX-T Data Center 3.X-Umgebungen verantwortlich sind. Diese Prüfung auf fortgeschrittenem Niveau ist Teil des VMware Certified Advanced Professional (VCAP)-Programms und richtet sich an erfahrene VMware-Profis, die bereits Expertise in Virtualisierungs-, Netzwerk- und Sicherheitstechnologien erworben haben.

>> 3V0-41.22 Praxisprüfung <<

VMware 3V0-41.22 Pruefungssimulationen & 3V0-41.22 Prüfungsfragen

Wenn Sie die schwierige VMware 3V0-41.22 Zertifizierungsprüfung bestehen wollen, ist es unmöglich für Sie bei der Vorbereitung keine richtige Schulungsunterlagen benutzen. Wenn Sie die ausgezeichnete Lernhilfe finden wollen, sollen Sie an DeutschPrüfung diese Prüfungsunterlagen suchen. Wir DeutschPrüfung haben sehr guten Ruf und haben viele ausgezeichnete Dumps zur VMware 3V0-41.22 Prüfung. Und wir bieten kostenlose Demo aller verschieden Dumps. Wenn Sie suchen, ob DeutschPrüfung Dumps für Sie geeignet sind, können Sie zuerst die Demo herunterladen und probieren.

Um sich auf die VMware 3V0-41.22-Zertifizierungsprüfung vorzubereiten, können Kandidaten verschiedene von VMware angebotene Schulungsressourcen nutzen. Diese Ressourcen umfassen Schulungen, Online-Kurse und Übungsprüfungen. Kandidaten können auch von praktischen Erfahrungen und praktischem Wissen beim Bereitstellen und Verwalten von NSX-T-Rechenzentrum 3.x profitieren. Mit der richtigen Vorbereitung und Engagement können die Kandidaten die VMware 3V0-41.22-Zertifizierungsprüfung bestehen und ihre Fachkenntnisse in der erweiterten Bereitstellung von VMware NSX-T Data Center 3.x demonstrieren.

VMware Advanced Deploy VMware NSX-T Data Center 3.X 3V0-41.22 Prüfungsfragen mit Lösungen (Q15-Q20):

15. Frage
SIMULATION
Task 8
You are tasked With troubleshooting the NSX IPSec VPN service Which has been reported down. Verify the current NSX configuration is deployed and resolve any issues.
You need to:
* Verify the present configuration as provided below:

NSX IPSec Session Name:	IPSEC
Remote IP:	192.168.140.2
Local Networks:	10.10.10.0/24
Remove Networks:	10.10.20.0/24
Pre-shared Key:	VMware1!VMware1!

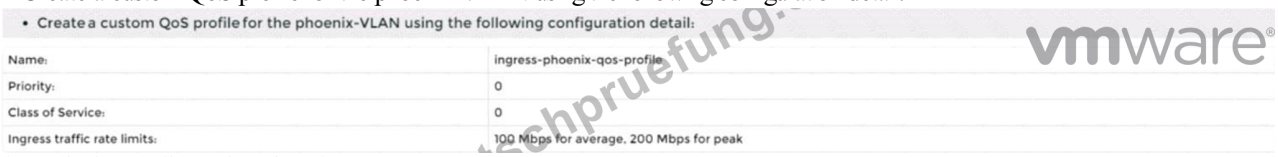
Complete the requested task.
Notes: Passwords are contained in the user_readme.txt. This task is not dependent on another. This task Should take approximately 15 minutes to complete.

Antwort:

Begründung:
See the Explanation part of the Complete Solution and step by step instructions Explanation:
To troubleshoot the NSX IPSec VPN service that has been reported down, you need to follow these steps:
Log in to the NSX Manager UI with admin credentials. The default URL is https://<nsx-manager-ip-address>.
Navigate to Networking > VPN > IPSec VPN and select the IPSec VPN session that is down. You can identify the session by its name, local endpoint, remote endpoint, and status.
Click Show IPSec Statistics and view the details of the IPSec VPN session failure. You can see the error message, the tunnel state, the IKE and ESP status, and the statistics of the traffic sent and received.
Compare the configuration details of the IPSec VPN session with the expected configuration as provided below. Check for any discrepancies or errors in the parameters such as local and remote endpoints, local and remote networks, IKE and ESP profiles, etc.
If you find any configuration errors, click Actions > Edit and modify the parameters accordingly. Click Save to apply the changes.
If you do not find any configuration errors, check the connectivity and firewall rules between the local and remote endpoints. You can use ping or traceroute commands from the NSX Edge CLI to test the connectivity. You can also use show service ipsec command to check the status of IPSec VPN service on the NSX Edge.
If you find any connectivity or firewall issues, resolve them by adjusting the network settings or firewall rules on the NSX Edge or the third-party device.
After resolving the issues, verify that the IPSec VPN session is up and running by refreshing the IPSec VPN page on the NSX Manager UI. You can also use show service ipsec sp and show service ipsec sa commands on the NSX Edge CLI to check the status of security policy and security association for the IPSec VPN session.

16. Frage
Task 7
you are asked to create a custom QoS profile to prioritize the traffic on the phoenix-VLAN segment and limit the rate of ingress traffic.
You need to:

* Create a custom QoS profile for the phoenix-VLAN using the following configuration detail:



- Create a custom QoS profile for the phoenix-VLAN using the following configuration detail:

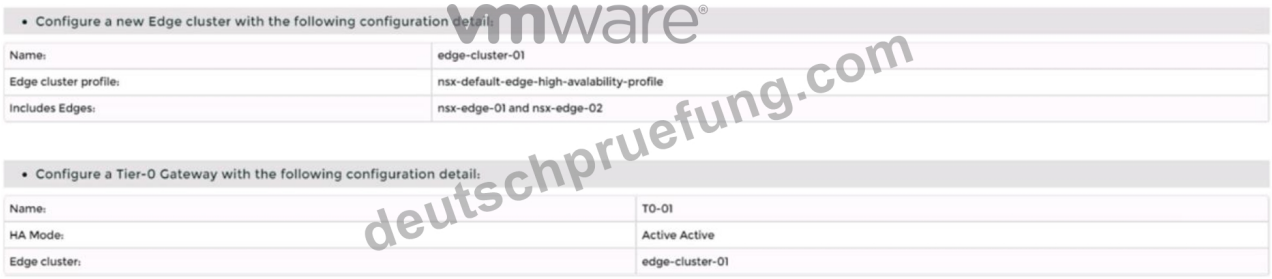
Name:	ingress-phoenix-qos-profile
Priority:	0
Class of Service:	0
Ingress traffic rate limits:	100 Mbps for average, 200 Mbps for peak

* Apply the profile on the 'phoenix-VLAN' segment
Complete the requested task.
Notes: Passwords are contained in the user_readme.txt.
take approximately 5 minutes to complete.
Subsequent tasks may require the completion of this task.
This task should See the Explanation part of the Complete Solution and step by step instructions.

Antwort:

Begründung:
Explanation
To create a custom QoS profile to prioritize the traffic on the phoenix-VLAN segment and limit the rate of ingress traffic, you need to follow these steps:
Log in to the NSX Manager UI with admin credentials. The default URL is https://<nsx-manager-ip-address>.
Navigate to Networking > Segments > Switching Profiles and click Add Switching Profile. Select QoS as the profile type.
Enter a name and an optional description for the QoS profile, such as phoenix-QoS.
In the Mode section, select Untrusted as the mode from the drop-down menu. This will allow you to set a custom DSCP value for the outbound IP header of the traffic on the segment.
In the Priority section, enter 46 as the DSCP value. This will mark the traffic with Expedited Forwarding (EF) per-hop behavior, which is typically used for high-priority applications such as voice or video.
In the Class of Service section, enter 5 as the CoS value. This will map the DSCP value to a CoS value that can be used by VLAN-based logical ports or physical switches to prioritize the traffic.
In the Ingress section, enter 1000000 as the Average Bandwidth in Kbps. This will limit the rate of inbound traffic from the VMs to the logical network to 1 Mbps.
Optionally, you can also configure Peak Bandwidth and Burst Size settings for the ingress traffic, which will allow some burst traffic above the average bandwidth limit for a short duration.
Click Save to create the QoS profile.
Navigate to Networking > Segments and select the phoenix-VLAN segment that you want to apply the QoS profile to.
Click Actions > Apply Profile and select phoenix-QoS as the switching profile that you want to apply to the segment.
Click Apply to apply the profile to the segment.
You have successfully created a custom QoS profile and applied it to the phoenix-VLAN segment.

17. Frage
SIMULATION
Task 3
You are asked to deploy a new instance of NSX-T into an environment with two isolated tenants. These tenants each have separate physical data center cores and have standardized on BCP as a routing protocol.
You need to:

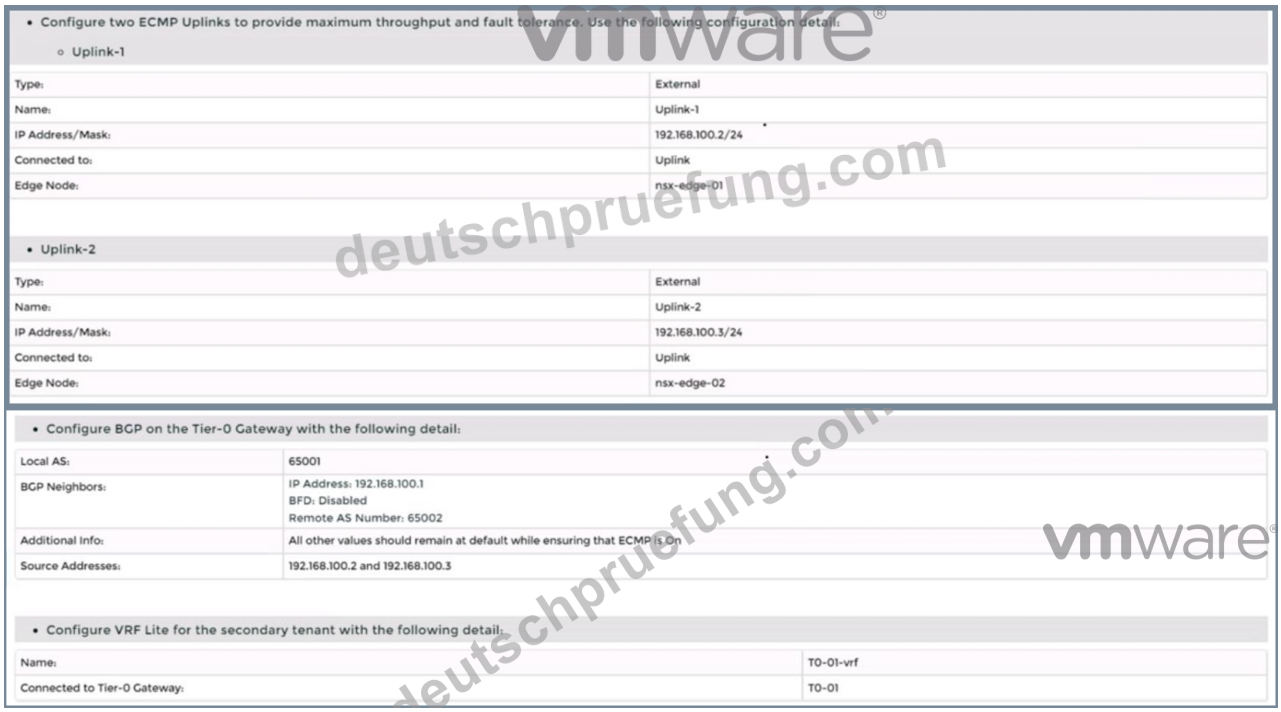


- Configure a new Edge cluster with the following configuration detail:

Name:	edge-cluster-01
Edge cluster profile:	nsx-default-edge-high-avalability-profile
Includes Edges:	nsx-edge-01 and nsx-edge-02

- Configure a Tier-0 Gateway with the following configuration detail:

Name:	T0-01
HA Mode:	Active Active
Edge cluster:	edge-cluster-01



Complete the requested task.
Notes: Passwords are Contained in the user_readme.txt. Task 3 is dependent on the Completion Of Task and 2. Other tasks are dependent On the Completion Of this task. Do not wait for configuration changes to be applied in this task as processing may take up to 10 minutes to complete. Check back on completion. This task should take approximately 10 minutes to complete.

Antwort:

Begründung:
See the Explanation part of the Complete Solution and step by step instructions Explanation:
To deploy a new instance of NSX-T into an environment with two isolated tenants, you need to follow these steps:
Log in to the NSX Manager UI with admin credentials. The default URL is https://<nsx-manager-ip-address>.
Navigate to System > Fabric > Nodes > Edge Transport Nodes and click Add Edge VM.
Enter a name and an optional description for the edge VM. Select the compute manager, cluster, and resource pool where you want to deploy the edge VM. Click Next.
Select the deployment size and form factor for the edge VM. For this task, you can select Medium as the size and VM as the form factor. Click Next.
Select the datastore and folder where you want to store the edge VM files. Click Next.
Configure the management network settings for the edge VM. Enter a hostname, a management IP address, a default gateway, a DNS server, and a domain search list. Optionally, you can enable SSH and join the edge VM to a domain. Click Next.
Configure the transport network settings for the edge VM. Select an N-VDS as the host switch type and enter a name for it. Select an uplink profile from the drop-down menu or create a new one by clicking New Uplink Profile. Map the uplinks to the physical NICs on the edge VM. For example, map Uplink 1 to fp-eth0 and Uplink 2 to fp-eth1. Optionally, you can configure IP assignment, MTU, or LLDP for the uplinks. Click Next.
Review the configuration summary and click Finish to deploy the edge VM.
Repeat steps 2 to 8 to deploy another edge VM for redundancy.
Navigate to Networking > Tier-0 Gateway and click Add Gateway > VRF.
Enter a name and an optional description for the VRF gateway. Select an existing tier-0 gateway as the parent gateway or create a new one by clicking New Tier-0 Gateway.
Click VRF Settings and enter a VRF ID for the tenant. Optionally, you can enable EVPN settings if you want to use EVPN as the control plane protocol for VXLAN overlay networks.
Click Save to create the VRF gateway.
Repeat steps 10 to 13 to create another VRF gateway for the second tenant with a different VRF ID.
Navigate to Networking > Segments and click Add Segment.
Enter a name and an optional description for the segment. Select VLAN as the connectivity option and enter a VLAN ID for the segment. For example, enter 128 for Tenant A's first uplink VLAN segment.
Select an existing transport zone from the drop-down menu or create a new one by clicking New Transport Zone.
Click Save to create the segment.
Repeat steps 15 to 18 to create three more segments for Tenant A's second uplink VLAN segment (VLAN ID 129) and Tenant B's uplink VLAN segments (VLAN ID 158 and 159).

Navigate to Networking > Tier-0 Gateway and select the VRF gateway that you created for Tenant A.
Click Interfaces > Set > Add Interface.
Enter a name and an optional description for the interface.
Enter the IP address and mask for the external interface in CIDR format, such as 10.10.10.1/24.
In Type, select External.
In Connected To (Segment), select the VLAN segment that you created for Tenant A's first uplink VLAN segment (VLAN ID 128).
Select an edge node where you want to attach the interface, such as Edge-01.
Enter the Access VLAN ID from the list as configured for the segment, such as 128.
Click Save and then Close.
Repeat steps 21 to 28 to create another interface for Tenant A's second uplink VLAN segment (VLAN ID 129) on another edge node, such as Edge-02.
Repeat steps 20 to 29 to create two interfaces for Tenant B's uplink VLAN segments (VLAN ID 158 and 159) on each edge node using their respective VRF gateway and IP addresses.
Configure BGP on each VRF gateway using NSX UI or CLI commands12. You need to specify the local AS number, remote AS number, BGP neighbors, route redistribution, route filters, timers, authentication, graceful restart, etc., according to your requirements34.
Configure BGP on each physical router using their respective CLI commands56. You need to specify similar parameters as in step 31 and ensure that they match with their corresponding VRF gateway settings78.
Verify that BGP sessions are established between each VRF gateway and its physical router neighbors using NSX UI or CLI commands . You can also check the routing tables and BGP statistics on each device .
You have successfully deployed a new instance of NSX-T into an environment with two isolated tenants using VRF Lite and BGP.

18. Frage
Task 11
upon testing the newly configured distributed firewall policy for the Boston application. it has been discovered that the Boston-Web virtual machines can be "pinged" via ICMP from the main console. Corporate policy does not allow pings to the Boston VMs.
You need to:
* Troubleshoot ICMP traffic and make any necessary changes to the Boston application security policy.
Complete the requested task.
Notes: Passwords are contained in the user _readme.txt. This task is dependent on Task 5.

Antwort:

Begründung:
See the Explanation part of the Complete Solution and step by step instructions.
Explanation
To troubleshoot ICMP traffic and make any necessary changes to the Boston application security policy, you need to follow these steps:
Log in to the NSX Manager UI with admin credentials. The default URL is https://<nsx-manager-ip-address>.
Navigate to Security > Distributed Firewall and select the firewall policy that applies to the Boston application. For example, select Boston-web-Application.
Click Show IPSec Statistics and view the details of the firewall rule hits and logs. You can see which rules are matching the ICMP traffic and which actions are taken by the firewall.
If you find that the ICMP traffic is allowed by a rule that is not intended for it, you can edit the rule and change the action to Drop or Reject. You can also modify the source, destination, or service criteria of the rule to make it more specific or exclude the ICMP traffic.
If you find that the ICMP traffic is not matched by any rule, you can create a new rule and specify the action as Drop or Reject. You can also specify the source, destination, or service criteria of the rule to match only the ICMP traffic from the main console to the Boston web VMs.
After making the changes, click Publish to apply the firewall policy.
Verify that the ICMP traffic is blocked by pinging the Boston web VMs from the main console again.You should see a message saying "Request timed out" or "Destination unreachable".

19. Frage
SIMULATION
Task 6

You are asked to integrate NSX manager with LDAP to better control NSX administrators' roles and responsibilities. Ensure users can manage the NSX environment utilizing Active Directory login credentials.
You need to:
* Configure NSX Manager LDAP integration to the corp.local domain using the following configuration detail:

- Configure NSX Manager LDAP integration to the corp.local domain using the following configuration detail:

LDAP identity source name:	corp.local
Domain Name:	corp.local
BASE DN:	DC=CORP, DC=local
Type:	Active Directory over LDAP
Active Directory host name:	controlcenter.corp.local
LDAP Protocol:	LDAP
LDAP Port:	389
User Start TLS:	disabled
Bind identity user name:	administrator@corp.local
Bind identity password:	VMware1!

* Configure the user nsx-admin@corp.local Active Directory account as an Enterprise Admin access role.
Complete the requested task.
Notes:
Passwords are contained in the user_readme.txt. You may want to move to other tasks/steps while waiting for configuration changes to be applied. This task should take approximately 15 minutes to complete.

Antwort:

Begründung:
See the Explanation part of the Complete Solution and step by step instructions Explanation:
To integrate NSX Manager with LDAP to better control NSX administrators' roles and responsibilities, you need to follow these steps:
Log in to the NSX Manager UI with admin credentials. The default URL is https://<nsx-manager-ip-address>.
Navigate to System > User Management > LDAP and click Add Identity Source.
Enter a name for the identity source, such as corp.local.
Enter the domain name of your Active Directory server, such as DC=corp,DC=local.
Select Active Directory over LDAP as the type from the drop-down menu.
Click Set to configure LDAP servers. You can add up to three LDAP servers for failover support, to each domain.
Enter the hostname or IP address of your LDAP server, such as corpdcserver.corp.local.
Select LDAP as the protocol from the drop-down menu.
Enter the port number for the LDAP server, such as 389.
Click Connection Status to test the connection to the LDAP server. If successful, you will see a green check mark and a message saying "Connection successful".
Optionally, you can enable StartTLS to use encryption for the LDAP connection. To do this, toggle the Use StartTLS button and enter the certificate of the LDAP server in PEM format in the text box below.
Click Save to add the LDAP server.
Repeat steps 6 to 12 to add more LDAP servers if needed.
Enter the bind entry user name and password for the LDAP server, such as Administrator@corp.local and VMware1!.
Click Save to create the identity source.
Navigate to System > User Management > Users and Roles and click Add Role Assignment for LDAP.
Select corp.local as the domain from the drop-down menu.
Enter nsx-admin@corp.local in the search box and select it from the list that appears.
Select Enterprise Admin as the role from the drop-down menu.
Click Save to assign the role to the user.
You have successfully integrated NSX Manager with LDAP and configured nsx-admin@corp.local Active Directory account as an Enterprise Admin access role.
