VMware NSX 4.x Advanced Design Sample Questions (Q45-Q50):

NEW QUESTION # 45

Logical design includes which of the following components? (Choose two)

- A. The color scheme of the user interface
- B. The definition of relationships between different parts of the system
- C. The abstract representation of the data flow
- D. The physical layout of the data center

Answer: B,C

NEW QUESTION # 46

Multitier architectures in NSX provide control over stateful service location by:

- A. Centralizing all network services in a single tier
- B. Separating services that require statefulness from those that do not
- C. Limiting the bandwidth available to certain applications
- D. Requiring all traffic to pass through a physical router

Answer: B

NEW QUESTION # 47

Which of the following would be an example of an assumption that a solutions architect needs to consider in the design of an NSX solution?

- A. The customer has limited resources available for the implementation, such as personnel or hardware.
- B. The customer thinks that NSX will be able to integrate with their existing infrastructure.
- C. The customer wants to be able to scale the NSX solution as their business grows.
- D. The customer requires support for virtualized workloads across multiple hypervisors.

Answer: B

Explanation:

1. Understanding Assumptions in NSX Design

* Assumptions are conditions that are expected to be true but have not been verified.

* A good NSX design requires assumptions to be validated before deployment to avoid unexpected issues.

2. Why "Customer Assumes NSX Will Integrate with Existing Infrastructure" is Correct (A)

* Integration with existing infrastructure (e.g., physical networks, firewalls, cloud providers) must be validated.

* Assuming compatibility without testing can cause deployment failures or feature limitations.

* Common integration challenges include: VLAN scalability, MTU size mismatch, or unsupported physical networking hardware.

3. Why Other Options are Incorrect

* (B - Requirement for Multi-Hypervisor Support):

* This is a defined requirement, not an assumption.

* (C - Scalability Needs):

- * This is a business requirement, not an assumption.
 - * (D - Limited Resources):
 - * This is a constraint that affects the deployment, not an assumption.
4. NSX Design Considerations for Infrastructure Integration
- * Perform a thorough assessment of existing hardware and network compatibility.
 - * Validate the interoperability of NSX with third-party services (firewalls, storage, monitoring tools).
 - * Plan for phased integration testing to reduce risks.

- * NSX-T Interoperability and Integration Guide

NEW QUESTION # 48

What are the benefits of a centralized gateway architecture in NSX?

- **A. Improved scalability, increased redundancy, and faster failover times**
- B. Better load balancing, easier troubleshooting, and lower hardware costs
- C. Better application performance, improved network visibility, and easier management
- D. Simplified network design, reduced network latency, and improved security

Answer: A

Explanation:

- * Advantages of a Centralized NSX Gateway Architecture (Correct Answer - D):
 - * Scalability:
 - * A centralized Tier-0 Gateway allows for consistent external connectivity across multiple NSX instances.
 - * Redundancy:
 - * Active-Active and Active-Standby configurations provide high availability (HA).
 - * Faster Failover:
 - * BGP/OSPF dynamic routing ensures rapid recovery in case of gateway failure.
 - * Incorrect Options:
 - * (A - Load Balancing & Troubleshooting):
 - * Load balancing is handled by NSX Advanced Load Balancer, not centralized gateways.
 - * (B - Simplified Network Design & Security):
 - * While security improves, this answer misses key benefits like failover and redundancy.
 - * (C - Network Visibility & Application Performance):
 - * Visibility and performance depend on monitoring tools, not just gateway centralization.

- * NSX-T Gateway and Routing Best Practices
 - * NSX-T High Availability and Failover Design Guide

NEW QUESTION # 49

What is a design justification for a solution with 3 NSX Manager nodes deployed in a 4 ESXi cluster Management Cluster?

- A. Compute consumption guarantees NSX Manager nodes can be run on the same ESXi host.
- **B. Single point of failure on Control Plane and Management Plane will be mitigated.**
- C. NSX Controllers are separated from NSX Managers allowing 6 ESXi servers to host them.
- D. NSX Management Plane and Control Plane will be reduced to a single point of failure.

Answer: B

Explanation:

- * 3 NSX Manager Nodes for HA & Redundancy (Correct Answer - B):
- * NSX requires 3 Manager nodes for high availability (HA) and Control Plane redundancy.
- * If a single NSX Manager node fails, the other nodes continue to operate, preventing single points of failure.
- * Incorrect Options:
- * (A - Run All Nodes on One Host):
- * This contradicts best practices, as NSX Manager nodes should be distributed across multiple hosts.
- * (C - Reducing Control Plane to a Single Point of Failure):
- * The 3-node setup prevents this, ensuring failover capability.

* (D - Separating NSX Controllers from Managers):

* In NSX-T 3.x/4.x, NSX Controllers are part of the Manager cluster, so there are no separate NSX Controllers.
