VMware NSX 4.x Advanced Design Sample Questions (Q138-Q143):

NEW QUESTION # 138

Stretched security use cases in Federation are primarily designed to?

- A. Eliminate the need for a security policy
- B. Maintain consistent security postures across multiple locations
- C. Focus solely on physical security enhancements
- D. Reduce the overall number of firewalls deployed

Answer: B

NEW QUESTION # 139

Which three choices are part of a Design Approach when discussing design alternatives and their effects?(Choose three.)

- A. Budget
- B. Security
- C. Cost

- D. Performance
- E. Knowledge
- F. Backup

Answer: A,C,D

Explanation:

- * Key Design Considerations (Correct Answers - B, C, E):
- * Budget: Determines hardware, licensing, and NSX deployment costs.
- * Cost: Affects NSX scalability, high availability, and feature selection.
- * Performance: Defines bandwidth requirements, throughput, and overlay network efficiency.

* Incorrect Options:

- * (A - Backup):
- * Backup is an operational consideration, not a design alternative.
- * (D - Knowledge):
- * While engineers need NSX knowledge, this is not a technical design factor.
- * (F - Security):
- * Security is important but should be integrated into budget and performance discussions.

NEW QUESTION # 140

Guidelines for designing top-of-rack switches often emphasize? (Choose two)

- A. Low latency for intra-rack communications
- B. The aesthetic appeal of the switch design
- C. The use of wireless technology to connect rack devices
- D. High throughput to accommodate rack-level traffic

Answer: A,D

NEW QUESTION # 141

What are the benefits of a centralized gateway architecture in NSX?

- A. Improved scalability, increased redundancy, and faster failover times
- B. Better load balancing, easier troubleshooting, and lower hardware costs
- C. Simplified network design, reduced network latency, and improved security
- D. Better application performance, improved network visibility, and easier management

Answer: A

Explanation:

- * Advantages of a Centralized NSX Gateway Architecture (Correct Answer - D):
- * Scalability:
- * A centralized Tier-0 Gateway allows for consistent external connectivity across multiple NSX instances.
- * Redundancy:
- * Active-Active and Active-Standby configurations provide high availability (HA).
- * Faster Failover:
- * BGP/OSPF dynamic routing ensures rapid recovery in case of gateway failure.
- * Incorrect Options:
- * (A - Load Balancing & Troubleshooting):
- * Load balancing is handled by NSX Advanced Load Balancer, not centralized gateways.
- * (B - Simplified Network Design & Security):
- * While security improves, this answer misses key benefits like failover and redundancy.
- * (C - Network Visibility & Application Performance):
- * Visibility and performance depend on monitoring tools, not just gateway centralization.

NEW QUESTION # 142

A rapidly growing e-commerce company, with a global customer base, is seeking to enhance their current network infrastructure to ensure a seamless and secure user experience. They have opted for VMware NSX to leverage software-defined networking (SDN) capabilities, and are particularly interested in employing NSX Edge to maximize their network performance.

A solutions architect is tasked with designing an effective and efficient solution using NSX Edge that meets the customer's requirements. The design should incorporate North-South routing to handle traffic to and from the internet.

To meet the company's requirements, what optimal solution should the solutions architect recommend, utilizing NSX Edge?

- A. Deploy a single NSX Edge node and use a separate physical router for East-West routing.
- B. Deploy multiple NSX Edge nodes and configure a Tier-0 Gateway in Active-Standby mode for North-South routing services.
- C. Deploy a single NSX Edge node for North-South routing services.
- D. Deploy multiple NSX Edge nodes and configure a Tier-0 Gateway in Active-Active mode for North-South routing services.

Answer: D

Explanation:

1. Importance of NSX Edge for North-South Traffic

* NSX Edge nodes provide routing, NAT, firewall, and load balancing services for North-South traffic(external connectivity).

* Active-Active Tier-0 Gateway provides maximum performance and resiliency for high traffic volume.

2. Why Active-Active Tier-0 with Multiple Edge Nodes is the Best Choice (D)

* Supports Equal-Cost Multi-Path (ECMP) routing, distributing North-South traffic across multiple paths.

* Provides better scalability and performance than Active-Standby mode.

* Ideal for high-volume applications like e-commerce sites that require low-latency, high-throughput connections.

3. Why Other Options are Incorrect

* (A - Single NSX Edge Node):

* Single Edge Nodes introduce a single point of failure.

* (B - Using a Physical Router for East-West Routing):

* NSX handles East-West traffic internally using Distributed Routing.

* (C - Active-Standby Tier-0 Gateway):

* Active-Standby mode does not provide load balancing across multiple nodes.

4. NSX Edge and Tier-0 Gateway Design Considerations

* Ensure sufficient bandwidth allocation for North-South traffic.

* Use BGP or OSPF for dynamic route advertisement.

* Configure ECMP for efficient multi-path forwarding.
