Cisco 400-007 Exam is a comprehensive test that covers a wide range of topics related to network design. Candidates are expected to have a deep understanding of network protocols, routing and switching technologies, security, network management, and network optimization. In addition, candidates should have experience in designing networks for large organizations and should be able to demonstrate their ability to create effective and efficient network architectures.

Cisco Certified Design Expert (CCDE v3.0) Written Exam Sample Questions (Q327-Q332):

NEW QUESTION # 327

Which two impacts of adding the IP event dampening feature to a network design are true? (Choose two.)

- A. It speeds up link failure detection.
- B. It protects against routing loops.
- C. It switches traffic immediately after a link failure.
- **D. It improves overall network stability.**
- **E. It reduces the utilization of system processing resources.**

Answer: D,E

Explanation:

IP Event Dampening suppresses route flaps caused by unstable interfaces or links:

* D: By suppressing frequent route flaps, it reduces unnecessary routing updates and reduces CPU utilization and control plane processing.

* E: This suppression stabilizes the overall routing system, especially in large networks where constant recalculation would otherwise occur.

Why other options are incorrect:

* A: It does not directly prevent routing loops.

* B: It intentionally delays re-advertising to ensure stability, not immediate switching.

* C: Detection speed is unaffected; suppression happens after detection.

NEW QUESTION # 328

What is the most important operational driver when building a resilient and secure modular network design?

- A. Dependencies on hardware or software that is difficult to scale
- **B. Reduce the frequency of failures requiring human intervention**
- C. Increase time spent on developing new features
- D. Minimize app downtime

Answer: B

Explanation:

A modular, scalable network design aims to:

- * Localize faults
- * Reduce impact radius of failures
- * Enable automated fault detection and recovery

The primary operational driver is to reduce the need for manual intervention during failures, which translates to:

- * Faster recovery times
- * Consistency in troubleshooting
- * Improved service reliability

While minimizing app downtime (B) is a goal, it is a result of reducing human-required failure recovery.

Option C is a business process goal, and D is an architectural challenge, not an operational driver.

This aligns with CCDE v3.1's "Network Architecture Principles" for building operationally resilient networks.

NEW QUESTION # 329

Company XYZ runs OSPF in their network. A design engineer decides to implement hot-potato routing architecture. How can this implementation be achieved?

- A. Redistribute the external prefixes onto OSPF and ensure the total metric calculation includes only the ext value and the value is the same in all ASBRs.
- **B. Redistribute the external prefixes onto OSPF and ensure that the total metric calculation includes external internal values.**
- C. Enable iBGP and apply prepend to ensure all prefixes will have the same length of the AS path attribute value.
- D. Enable OSPF load-balancing over unequal cost path.

Answer: B

NEW QUESTION # 330

You want to split an Ethernet domain in two.

Which parameter must be unique in this design to keep the two domains separated?

- A. STP type
- B. VTP password
- C. VLAN ID
- **D. VTP domain**

Answer: D

Explanation:

To split an Ethernet domain and ensure isolation of configuration and topology changes, the key mechanism is separating the VLAN management domains. This is achieved through:

* VTP (VLAN Trunking Protocol) domain separation

Each VTP domain controls its own set of VLAN information and will not propagate VLAN changes across domain boundaries. By assigning unique VTP domain names to each half of the network, administrators prevent unintended synchronization of VLANs between switches.

Other options:

* B. VTP password: Adds security but does not separate domains.

* C. STP type: All switches in the domain can run the same or different STP versions and still be part of the same Ethernet domain.

* D. VLAN ID: These can overlap across domains; uniqueness is not required to split domains.

NEW QUESTION # 331

What is a disadvantage of the traditional three-tier architecture model when east west traffic between different pods must go through the distribution and core layers?

- A. scalability
- B. security
- **C. high latency**
- D. low bandwidth

Answer: C
