Complete 3V0-22.25 Download Fee & Newest VMware Certification Training - Authorized VMware Advanced VMware Cloud Foundation 9.0 Operation

Advanced VMware Cloud Foundation 9.0 Operation 3V0-22.25 study guide are high quality, since we have a professional team to collect the information for the exam, and we can ensure you that 3V0-22.25 study guide you receive are the latest information we have. In order to strengthen your confidence for VMware 3V0-22.25 Exam Dumps, we are pass guarantee and money back guarantee.

VMware Advanced VMware Cloud Foundation 9.0 Operation Sample Questions (Q108-Q113):

NEW QUESTION # 108

A Solution Architect is designing a VCF Operations cluster for a financial institution that requires zero downtime even in the event of a complete data center failure.

Requirements

- RPO: 0 (No data loss)
- RTO: Near Zero (Automated failover)
- Architecture: Dual-Site (Active/Active capable)

Which availability mode must be selected during the sizing and deployment phase to meet these strict criteria?

- A. High Availability (HA) with Asynchronous Replication.
- B. Standard Availability with vSphere Replication.
- C. Continuous Availability (CA) with a Stretched Cluster architecture.
- D. Federated Analytics with Cross-Site Replay.

Answer: C

NEW QUESTION # 109

A team uses Ansible (Open Source) heavily for application configuration. They want to drag-and-drop their existing Ansible Playbooks onto the VCF Automation design canvas to run post-provisioning tasks on new VMs. Which prerequisite must be met to enable this capability?

- A. Configure an Ansible Integration in Assembler and specify the "Ansible Control Machine" (host) where the playbooks reside. This integration allows the canvas to inventory the playbooks and execute them via SSH/WinRM from the control node to the newly deployed VM.
- B. Convert all Playbooks to vRO Workflows.
- C. Enable "Cloud-Init".
- D. Install the Ansible agent on every VM template.

Answer: A

NEW QUESTION # 110

A Cloud Admin is troubleshooting a "Stale Data" issue. The "Last Collection" timestamp for a vCenter instance is current (Green), but users report that the metric values for VMs (e.g., CPU Usage) have been a flat line for the last 4 hours, despite known activity.

Diagnostics

Adapter Status: Data Receiving

Collection Status: Success

Integration Point Analysis

vCenter Performance Charts (Source): Shows dynamic, changing data.

VCF Ops Metric Graph: Shows "Static Value" (Flatline).

Logs

[INFO] Processing metric payload... 500 metrics dropped.

[WARN] Metric content validation failed.

What is the most likely architectural cause for "Success" status but "Flat/Stale" metric values?

- A. The vCenter Server Statistics Level is set to Level 1, which does not generate 5-minute data.
- B. The VCF Operations "Blacklist" (Metric Exclusion) configuration in the active Policy is enabled for these specific metrics, so the pipeline drops them and potentially repeats the last known value or shows null.
- C. The Analytics Cluster disk is full, so it is accepting connection handshakes (Status Green) but discarding the write payloads.
- D. The Cloud Proxy time is out of sync with the Analytics Cluster by more than 30 minutes, causing the data points to be discarded as "too old" or "future" upon ingestion.

Answer: D

NEW QUESTION # 111

Which component within the VCF Operations data collection architecture is responsible for bridging the communication between the external managed solution (such as a storage array or database) and the VCF Operations analytics engine?

- A. The Product UI Service
- B. The vCenter Server Event Broker
- C. The Adapter Instance (Management Pack)
- D. The SDDC Manager Lifecycle Agent

Answer: C

NEW QUESTION # 112

An operator observes that a specific Cloud Proxy (cp-tokyo-01) is offline in the VCF Operations UI. A network engineer provides the current firewall configuration between the Tokyo site and the central data center.

Firewall Rule - Edge-Tokyo to Core-DC

Source IP Dest IP Port/Protocol Action

10.20.1.5 (CP) 192.168.10.10 443 (TCP) ALLOW

10.20.1.5 (CP) 192.168.10.11 443 (TCP) ALLOW

10.20.1.5 (CP) 192.168.10.12 80 (TCP) DENY
10.20.1.5 (CP) 192.168.10.10 123 (UDP) ALLOW
VCF Operations Cluster Info (Core-DC)
Load Balancer VIP: 192.168.10.100
Nodes: 192.168.10.10, 10.11, 10.12

Based on the configuration, what is preventing the Cloud Proxy from successfully connecting and staying online?

- A. Port 80 is denied; the Cloud Proxy requires port 80 for initial certificate exchange and bootstrap.
- B. NTP (Port 123) is only allowed to one node; it must be open to all nodes for time synchronization.
- C. The Cloud Proxy is trying to initiate a connection over Port 22 (SSH), which is not listed in the rules.
- **D. The firewall rules allow traffic to individual nodes but do not explicitly allow traffic to the Cluster Load Balancer VIP (192.168.10.100) on port 443.**

Answer: D

NEW QUESTION # 113
