ValidExam is an experienced website with great reputation which offering Snowflake dumps torrent and professional explanations. Our DAA-C01 test questions are created by our IT elites who pay great attention to the IT exam certification so we can ensure you the authority and reliability of our DAA-C01 Practice Test.

Our website gives detailed guidance to our candidates for the preparations of DAA-C01 actual test and lead them toward the direction of success. Each question in DAA-C01 pass guide is certified by our senior IT experts to improve candidates' ability and skills. The quality of training materials and the price of our DAA-C01 Dumps Torrent are all created for your benefit. Just add it to your cart.

Free PDF Quiz DAA-C01 - High Pass-Rate SnowPro Advanced: Data Analyst Certification Exam Valid Test Braindumps

Under the guidance of our DAA-C01 preparation materials, you are able to be more productive and efficient, because we can provide tailor-made exam focus for different students, simplify the long and boring reference books by adding examples and

diagrams and our IT experts will update DAA-C01 guide torrent on a daily basis to avoid the unchangeable matters. And you are able to study DAA-C01 study torrent on how to set a timetable or a to-do list for yourself in your daily life, thus finding the pleasure during the learning process of our DAA-C01 study materials.

Snowflake SnowPro Advanced: Data Analyst Certification Exam Sample Questions (Q122-Q127):

NEW QUESTION # 122

In Snowflake, how does the implementation of primary keys for tables contribute to data integrity?

- A. Only works on specific data types
- **B. Enforces uniqueness in table rows**
- C. Limits data access for users
- D. Requires data redundancy

Answer: B

Explanation:

Primary keys enforce uniqueness in table rows, ensuring data integrity by preventing duplicate entries within a table.

NEW QUESTION # 123

You are responsible for maintaining a dashboard displaying real-time website traffic data'. The data is ingested into a Snowflake table named 'WEB EVENTS' using Snowpipe from cloud storage. The 'WEB EVENTS' table includes 'EVENT TIMESTAMP', 'PAGE URL', and 'USER ID' columns. The dashboard requires near real-time updates, but you are noticing significant latency. Which of the following actions, performed in isolation, is LEAST likely to improve the dashboard update frequency?

- A. Optimize the Snowpipe configuration by adjusting the 'COPY INTO' statement to use file format options appropriate for the source data (e.g., compression, field delimiters).
- **B. Reduce the frequency of micro-batch data loading by increasing the Snowpipe 'AUTO_INGEST' schedule to reduce the number of pipe executions per minute.**
- C. Create a materialized view that pre-aggregates the data needed for the dashboard and configure it for automatic refresh.
- D. Increase the size of the Snowflake virtual warehouse used for Snowpipe data loading.
- E. Refactor dashboard queries to directly query the 'WEB EVENTS' table without any aggregations or transformations.

Answer: B

Explanation:

Reducing the frequency of micro-batch data loading (option E) is LEAST likely to improve dashboard update frequency; in fact, it will decrease it. The dashboard needs near real-time updates, so reducing how often data is loaded will directly conflict with that requirement. All the other options are designed to help with optimization. Optimizing Snowpipe configuration, creating materialized views for pre-aggregation, and increasing warehouse size for Snowpipe can help, too. Reducing the amount of aggregations that dashboard needs will help since less processing is necessary.

NEW QUESTION # 124

When cleaning data, what role does using clones play in specific use-cases?

- **A. Clones aid in isolating and resolving data anomalies**
- B. Clones help preserve original data for audit purposes only
- C. Clones are unnecessary for data cleaning tasks
- D. Clones slow down the data cleaning process significantly

Answer: A

Explanation:

Clones are beneficial in isolating and resolving data anomalies without impacting the original dataset, facilitating safe data cleaning practices.

NEW QUESTION # 125

You have a Snowflake table named 'sensor_data' with a column 'reading' containing JSON data'. The JSON structure varies, but you want to extract a specific nested value, 'temperature', using a UDF. The path to 'temperature' might be different depending on the 'sensor_type'. Some sensors have the temperature at '\$.metrics.temperature', others at '\$.reading.temp_c'. The sensor type is stored in the 'sensor_type' column. You want to create a UDF named which takes the JSON 'reading' and the 'sensor_type' as input and extracts the temperature, returning NULL if the path does not exist in the JSON. How can you implement this using a JavaScript UDF and Snowflake's JSON parsing functions for optimal performance?

```
1 CREATE OR REPLACE FUNCTION get_temperature(reading VARIANT, sensor_type VARCHAR) RETURNS FLOAT LANGUAGE JAVASCRIPT AS $  
2 /r reading_json = JSON.parse(reading); if (sensor_type === 'type1') { return reading_json.metrics.temperature; } else if (sensor_type === 'type2') { return  
3 reading_json.reading.temp_c; } else { return null; } $$; '''  
4  
5 '''sql CREATE OR REPLACE FUNCTION get_temperature(reading VARIANT, sensor_type VARCHAR) RETURNS FLOAT LANGUAGE JAVASCRIPT AS $$  
6 ;sensor_type === 'type1') { return reading.metrics.temperature; } else if (sensor_type === 'type2') { return reading.reading.temp_c; } else { return null; } $$; '''  
7  
8 '''sql CREATE OR REPLACE FUNCTION get_temperature(reading VARIANT, sensor_type VARCHAR) RETURNS FLOAT LANGUAGE JAVASCRIPT AS $$  
9 ry { if (sensor_type === 'type1') { return reading.metrics.temperature; } else if (sensor_type === 'type2') { return reading.reading.temp_c; } else { return null; } }  
10 catch (e) { return null; } $$; '''  
11  
12 '''sql CREATE OR REPLACE FUNCTION get_temperature(reading VARCHAR, sensor_type VARCHAR) RETURNS FLOAT LANGUAGE JAVASCRIPT AS $  
13 /r reading_json = JSON.parse(reading); try { if (sensor_type === 'type1') { return reading_json.metrics.temperature; } else if (sensor_type === 'type2') { return  
14 reading_json.reading.temp_c; } else { return null; } } catch (e) { return null; } $$; '''  
15  
16 '''sql CREATE OR REPLACE FUNCTION get_temperature(reading VARIANT, sensor_type VARCHAR) RETURNS FLOAT LANGUAGE JAVASCRIPT AS $$  
17 ;sensor_type === 'type1') { return reading['metrics']['temperature']; } else if (sensor_type === 'type2') { return reading['reading']['temp_c']; } else { return null; } $$;
```

- A. Option C
- B. Option A
- C. Option D
- D. Option E
- E. Option B

Answer: A

Explanation:

Option C is the MOST optimal. It uses 'VARIANT as the input data type for 'reading', which avoids the unnecessary parsing of JSON using as Snowflake automatically parses JSON data into a VARIANT type. It also includes a 'try...catch' block to handle cases where the specified path does not exist within the JSON, returning 'NULL' as required. This prevents errors from halting the query. Using 'VARIANT directly and exception handling offers superior performance. Option A and D parse VARIANT as String, leading to parsing overhead. B misses the try catch block and is prone to failure when temp is not available for a given sensor. Option E is less efficient than option C due to using array notation.

NEW QUESTION # 126

Which aspects are crucial for making predictions based on data for forecasting purposes? (Select all that apply)

- A. Considering trends and anomalies in historical data
- B. Using only basic arithmetic functions for forecasting
- C. Relying solely on historical data without considering external factors
- D. Incorporating statistical methods for accurate predictions

Answer: A,D

Explanation:

Incorporating statistical methods and considering trends/anomalies are crucial for accurate predictions in forecasting.

NEW QUESTION # 127
