

NETA_2 Brain Exam | NETA_2 Online Tests

We strongly recommend using our NETA_2 exam dumps to prepare for the NETA Level 2 Certified Assistant Electrical Testing Specialist. It is the best way to ensure success. With our NETA_2 practice questions, you can get the most out of your studying and maximize your chances of passing your NETA_2 Exam. TrainingQuiz NETA Level 2 Certified Assistant Electrical Testing Specialist is the answer if you want to score higher in the NETA_2 exam and achieve your academic goals.

However, preparing for the NETA Level 2 Certified Assistant Electrical Testing Specialist (NETA_2) exam is not an easy job until they have real NETA Level 2 Certified Assistant Electrical Testing Specialist (NETA_2) exam questions that are going to help them achieve this target. They have to find a trusted source such as TrainingQuiz to reach their goals. Get NETA NETA_2 Certified, and then apply for jobs or get high-paying job opportunities.

NETA_2 Online Tests, NETA_2 New Test Materials

As we all know, if you want to pass the NETA_2 exam, you need to have the right method of study, plenty of preparation time, and targeted test materials. However, most people do not have one or all of these. That is why I want to introduce our NETA_2 Original Questions to you. So why not try our NETA original questions, which will help you maximize your pass rate? Even if you unfortunately fail to pass the exam, we will give you a full refund.

NETA Level 2 Certified Assistant Electrical Testing Specialist Sample Questions (Q30-Q35):

NEW QUESTION # 30

What is meant by a dead-tank circuit breaker?

- A. The breaker has no stored-energy operating mechanism
- B. The breaker uses air at atmospheric pressure as the interrupting medium
- C. The interrupter is mounted inside an insulating housing at line potential
- **D. The external tank is grounded, enclosing the interrupter and operating parts**

Answer: D

Explanation:

A dead-tank circuit breaker is designed so that the interrupter assembly and associated operating components are contained within a metal tank that is bonded to ground potential. Because the enclosure is grounded ("dead"), the tank is not energized during normal operation. This construction reduces touch potential hazards and provides a robust, grounded barrier around interrupting components.

This contrasts with a live-tank breaker, where the external housing or tank is at line potential, requiring greater external clearances and insulation coordination. From a testing perspective, NETA Level 2 work commonly includes verifying breaker integrity through

insulation resistance, contact resistance, functional checks, and in some applications, power factor testing or vacuum bottle integrity testing (depending on breaker type). Understanding "dead-tank" vs "live-tank" is important because it influences safe work practices, test lead placement, and interpretation of results (particularly for insulation-related tests and grounding considerations). NETA objectives emphasize technicians being able to identify equipment construction types and apply the appropriate test approach and safety controls, especially regarding grounded enclosures, bonding, and the management of induced or stored energy.

NEW QUESTION # 31

In which three-phase configuration are line current and phase current equal?

- A. Open-delta
- **B. Wye**
- C. Corner-grounded delta
- D. Delta

Answer: B

Explanation:

In a wye (star) connection, line current equals phase current. In delta systems, line current is $\sqrt{3}$ times phase current. NETA Level 2 technicians must recognize this distinction when interpreting ammeter readings, evaluating load balance, and performing commissioning tests on three-phase systems.

NEW QUESTION # 32

Using a typical breaker control diagram, which coil is most commonly associated with the anti-pump function?

- A. Closing coil
- **B. Anti-pump relay coil**
- C. Trip coil
- D. Auxiliary relay coil

Answer: B

Explanation:

The anti-pump relay coil prevents repeated closing attempts if the close command remains energized after a breaker closes and trips. This protects mechanical components and ensures controlled operation. NETA Level 2 technicians must verify anti-pump operation during control circuit testing to ensure breakers cannot continuously reclose under fault conditions.

NEW QUESTION # 33

The smallest particle of a substance that still retains the properties of that substance is a:

- **A. Molecule**
- B. Atom
- C. Ion
- D. Electron

Answer: A

Explanation:

A molecule is the smallest unit of a substance that retains its chemical and physical properties. This basic scientific principle supports understanding of insulating materials, gases, and liquids used in electrical equipment, particularly when discussing dielectric behavior and contamination effects.

NEW QUESTION # 34

A 120 VAC, 60 Hz circuit supplies a 10 A load at a 20° lagging power factor. What is the true power?

- A. 310.6 W
- B. 1,000 W
- C. 1,200 W
- D. 1,127.6 W

Answer: D

Explanation:

True power is calculated using

Here, V, A, and

Thus, W.

NETA Level 2 technicians must correctly distinguish apparent power from true power when evaluating loads, especially those with inductive characteristics.

NEW QUESTION # 35

.....

In line with the concept that providing the best service to the clients, our company has forged a dedicated service team and a mature and considerate service system. We not only provide the free trials before the clients purchase our NETA_2 study materials but also the consultation service after the sale. We provide multiple functions to help the clients get a systematical and targeted learning of our NETA_2 Study Materials. So the clients can trust our NETA_2 study materials without doubt.
