UiPath Automation Business Analyst Associate Exam (2023.10) Sample Questions (Q58-Q63):

NEW QUESTION # 58

What document outlines the tests to be performed and logistics for end-user testing after development?

- A. Application Tracker
- B. Solution Design Document (SDD)
- C. Project Readiness Checklist
- D. User Acceptance Testing (UAT) Plan

Answer: D

Explanation:

The User Acceptance Testing (UAT) Plan is the document that details how end-user testing will occur once development is complete. It defines the test cases, success criteria, testing timelines, and responsible parties from both the Implementation and Client Teams. This document is essential for organizing the UAT phase, ensuring that all involved stakeholders are aware of what will be tested, how issues will be logged, and who is responsible for resolving them. It also outlines the criteria that must be met for the automation to be considered acceptable and ready for production.

The UAT Plan supports a structured and transparent testing process, minimizing the risk of miscommunication and ensuring that the delivered solution meets business expectations. It helps validate that the automation aligns with the agreed-upon requirements, business rules, and user needs captured during the earlier stages of the project.

NEW QUESTION # 59

Which stage of the automation lifecycle defines how the future automated process will look?

- A. Solution Design
- B. Process Analysis
- C. UAT
- D. Kickoff

Answer: A

Explanation:

The Solution Design stage defines how the future automated process (To-Be process) will look. In this phase, the Solution Architect, with input from the Automation Developer and Project Manager, creates the Solution Design Document (SDD).

This document outlines the proposed automation structure, including:

- * Future-state process flows
- * Logic and modules to be developed
- * Exception handling strategies
- * Integration with systems
- * Infrastructure and access needs

The design ensures that the automation is scalable, maintainable, and aligned with both technical feasibility and business goals. The Solution Design stage serves as a bridge between the business understanding of the process (from the PDD) and the technical execution that follows in the development stage.

NEW QUESTION # 60

Which stage involves analyzing the As-Is process and preparing documentation like the PDD?

- A. Development and Testing
- **B. Process Analysis**
- C. Solution Design
- D. Project Closure

Answer: B

Explanation:

The Process Analysis stage involves thoroughly analyzing the As-Is process and preparing the Process Definition Document (PDD). This stage is led by the Business Analyst and Solution Architect, often with input from process Subject Matter Experts (SMEs) from the Client Team.

Key activities include:

- * Shadowing process performers
- * Mapping step-by-step workflows
- * Identifying exceptions and business rules
- * Documenting input/output data
- * Noting system interactions

The PDD created in this stage becomes the foundation for the Solution Design and subsequent development phases. Accurate and complete documentation ensures that the automation solution will meet business needs and be technically sound.

NEW QUESTION # 61

In the Kickoff stage, which of the following must be defined and communicated?

- A. Only UAT test cases
- B. Client team vacation schedules
- C. Post-deployment SLA
- **D. Access to Studio and Orchestrator**

Answer: D

Explanation:

In the Kickoff stage, access to key platforms like UiPath Studio and Orchestrator must be clearly defined and communicated. Early access planning is essential to avoid development delays and ensure that developers, robots, and testers can interact with the required environments and systems.

In many projects, delays occur because access provisioning is not handled upfront. That's why UiPath emphasizes capturing these details early in the Application Tracker, with input from the Solution Architect and Infrastructure Engineer.

By discussing access needs during Kickoff, teams can involve the Client IT team early, prepare credentials and environments, and prevent blockers during later stages such as development and testing.

NEW QUESTION # 62

What is the responsibility of the Project Manager in the UiPath Automation Implementation Methodology?

- A. Managing solution design and deployment
- **B. Coordinating implementation activities and managing risks**
- C. Providing infrastructure-related configurations
- D. Writing and approving code modules

Answer: B

Explanation:

The Project Manager is responsible for coordinating all implementation activities and managing project risks, timelines, and resources throughout the automation lifecycle. They serve as the primary point of contact between the Client Team and the Implementation Team.

Their key responsibilities include:

- * Defining and tracking project schedules
- * Managing communication among stakeholders
- * Facilitating meetings and escalations
- * Handling changes in scope, resources, or timelines
- * Monitoring deliverables and ensuring quality
