# Integration-Architect Actual Exam, Integration-Architect Certification Materials

P.S. Free 2026 Salesforce Integration-Architect dumps are available on Google Drive shared by ValidExam: https://drive.google.com/open?id=1dIvUfi5md-wFAG_SbZKFd6LVl3GyI66J

In traditional views, Integration-Architect practice materials need you to spare a large amount of time on them to accumulate the useful knowledge may appearing in the real exam. However, our Integration-Architect learning questions are not doing that way. According to data from former exam candidates, the passing rate has up to 98 to 100 percent. There are adequate content to help you pass the Integration-Architect Exam with least time and money.

In contemporary society, information is very important to the development of the individual and of society (Integration-Architect practice test), and information technology gives considerable power to those able to access and use it. Therefore, we should dare to explore, and be happy to accept new things. In terms of preparing for exams, we really should not be restricted to paper material, there are so many advantages of our electronic Integration-Architect Study Guide, such as High pass rate, Fast delivery and free renewal for a year to name but a few. I can assure you that you will pass the exam as well as getting the related certification as easy as rolling off a log.

Authoritative Integration-Architect – 100% Free Actual Exam | Integration-Architect Certification Materials

ValidExam has rich resources and Integration-Architect test questions. It equips with Integration-Architect exam simulations and test dumps. You can try to download questions and answers. Moreover, ValidExam answers real questions. Equipping with online Salesforce Integration-Architect Study Guide, 100% guarantee to Pass Your Integration-Architect Exam.

Salesforce Certified Integration Architect Sample Questions (Q15-Q20):

NEW QUESTION # 15
Northern Trail Outfitters (NTO) has an affiliate company that would like immediate notifications of changes to opportunities in the NTO Salesforce instance. The affiliate company has a CometD client available.
Which solution is recommended in order to meet the requirement?

- A. Create a PushTopic update event on the Opportunity Object to allow the subscriber to react to the streaming API.
- B. Create a connected app in the affiliate org and select the "Accept CometD API Requests".
- C. Configure External Services to call the subscriber in Apex in the Onchange Trigger event as part of the flow.
- D. A Implement a polling mechanism in the client that calls the SOAP API get updated method to get the ID values of each updated record.

Answer: A

Explanation:
Explanation
Streaming API is the best option for sending real-time notifications of changes to Salesforce data. Streaming API uses a publish-subscribe model to push relevant data to subscribers without polling. Streaming API supports PushTopic events, which are based on SOQL queries that define the data changes to listen for. The affiliate company can subscribe to a PushTopic event on the NTO Salesforce org and receive notifications whenever the data that matches the query changes. This way, the affiliate company can be informed of any updates to the opportunities in the NTO Salesforce instance.

NEW QUESTION # 16
An Architect has received a request to prevent employees that leave the company from accessing data in Salesforce after they are deactivated in the company's HR system.
What should an Architect determine before recommending a solution?

- A. Determine inbound integration requirements, then identify frequency.
- B. Determine data access prevention requirements, then identify frequency.
- C. Determine data volume requirements, then identify the loading schedule.
- D. Determine data access prevention requirements, then identify system constraints.

Answer: B

Explanation:
The Architect should determine the data access prevention requirements and then identify the system constraints before recommending a solution. The data access prevention requirements are the business rules and policies that define how to prevent deactivated employees from accessing Salesforce data. For example, the Architect should determine whether the HR system can send a notification to Salesforce when an employee is deactivated, or whether Salesforce needs to query the HR system periodically to check the employee status. The system constraints are the technical limitations and challenges that may affect the integration solution. For example, the Architect should determine whether the HR system supports outbound or inbound integration, what are the security and authentication protocols, what are the data formats and protocols, and what are the performance and scalability requirements. The frequency of the integration is not as important as the requirements and constraints, as it can be adjusted based on the business needs and technical feasibility. The data volume requirements and loading schedule are not relevant for this scenario, as they are more applicable for data migration or replication scenarios.

NEW QUESTION # 17

Northern Trail Outfitters is planning to create a native employee facing mobile app with the look and feel of Salesforce's Lighting Experience. The mobile ap needs to integrate with their Salesforce org.
Which Salesforce API should be used to implement this integration?

- A. Connect REST API
- B. User Interface API
- C. REST API
- D. Streaming API

Answer: B

NEW QUESTION # 18

An Architect has received a request to prevent employees that leave the company from accessing data in Salesforce after they are deactivated in the company's HR system.
What should an Architect determine before recommending a solution?

- A. Determine inbound integration requirements, then identify frequency.
- B. Determine data volume requirements, then identify the loading schedule.
- C. Determine data access prevention requirements, then identify system constraints.
- D. Determine data access prevention requirements, then identify frequency.

Answer: D

Explanation:
Explanation
The Architect should determine the data access prevention requirements and then identify the system constraints before recommending a solution. The data access prevention requirements are the business rules and policies that define how to prevent deactivated employees from accessing Salesforce data. For example, the Architect should determine whether the HR system can send a notification to Salesforce when an employee is deactivated, or whether Salesforce needs to query the HR system periodically to check the employee status.
The system constraints are the technical limitations and challenges that may affect the integration solution. For example, the Architect should determine whether the HR system supports outbound or inbound integration, what are the security and authentication protocols, what are the data formats and protocols, and what are the performance and scalability requirements. The frequency of the integration is not as important as the requirements and constraints, as it can be adjusted based on the business needs and technical feasibility. The data volume requirements and loading schedule are not relevant for this scenario, as they are more applicable for data migration or replication scenarios.

NEW QUESTION # 19

A global financial company sells financial products and services that include the following:
1. Bank Accounts
2. Loans
3. Insurance
The company has a core banking system that is state of the art and is the master system to store financial transactions, financial products and customer information. The core banking system currently processes 10M financial transactions per day. The CTO for the company is considering building a community port so that customers can review their bank account details, update their information and review their account financial transactions.
What should an integration architect recommend as a solution to enable customer community users to view their financial transactions?

- A. UseSalesforce Connect to display the financial transactions as an external object.
- B. Use Iframe to display core banking financial transactions data in the customer community.
- C. Use Salesforce Connect to display the financial transactions as an external object.
- D. Use Salesforce External Service to display financial transactions in a community lightningpage.

Answer: A

Explanation:
The integration architect should recommend using Salesforce Connect to display the financial transactions as an external object.
SalesforceConnect is a feature that allows you to integrate external data sources with Salesforce and access them in real time via

external objects. External objects are similar to custom objects, but they store metadata only and not data. You can use external objects to display data from the core banking system in the customer community without copying or syncing the data. You can also use standard Salesforce features, such as reports, dashboards, or global search, with external objects. Salesforce External Service is a feature that allows you to import an external schema definition and generate an Apex wrapper class that can invoke an external service. This is useful for integrating complex business processes or workflows with Salesforce, but not for displaying data in a community lightning page. Iframe is a HTML element that allows you to embed another web page within a web page. This is not a recommended solution for displaying data in a customer community, as it can pose security risks, performance issues, or user interface problems.
