질문 # 310

A set of security controls or system settings used to ensure uniformity of configuration through the IT environment?

- A. Baseline
- B. Patches
- C. Inventory
- D. Policy

정답: A

설명:

A baseline is a documented set of approved security controls, configurations, and system settings used as a standard across an IT environment. Baselines ensure consistency, security, and compliance by defining how systems should be configured before deployment and during operation.

Security baselines are commonly derived from frameworks such as CIS Benchmarks, NIST SP 800-53, and vendor hardening guides. They help reduce misconfigurations, which are a leading cause of security breaches.

Patches address specific vulnerabilities, inventory tracks assets, and policies define high-level rules and expectations. Baselines translate policies into actionable technical settings, such as password policies, logging configurations, and service restrictions. By enforcing baselines, organizations improve security posture, simplify audits, and enable faster incident response. Any deviation from the baseline can be detected and investigated, making baselines a cornerstone of secure and well-managed IT environments.
