## 最新的 Huawei-certification H12-841\_V1.5 免費考試真題 (Q305-Q310):

### 問題 #305

In MPLS VPN network troubleshooting, if it is necessary to "view the ARP table of the VPN instance on the PE device to confirm whether the CE device's MAC address is being learned normally", which of the following commands should be used?

- A. Display IP routing-table VPN instance [instance name]
- B. display bgp vpnv4 all routes
- C. display arp VPN instance [instance name]
- D. display mpls lsp

答案： C

### 問題 #306

Huawei's SD-WAN solution targets "Zero-Provisioning for Branches (ZTP)". Which of the following features can simplify the commissioning process for branch devices? (Multiple choice)

- A. Requires manual on-site configuration of device IP and management address.
- B. The device automatically obtains its IP address and management platform address after power-on.
- C. Automatically download and apply configuration files from the management platform.
- D. No manual on-site configuration required, achieving "plug and play" functionality.
- E. The configuration file needs to be copied to the device via USB flash drive, which is inefficient .

答案： B,C,D

### 問題 #307

(One particular WLAN architecture supported on a campus network has the following networking characteristics: The AP can work independently, or manage a small number of other APs to implement basic roaming functions; the cost is low, and network maintenance personnel only need limited skills. What is this WLAN architecture?)

- A. Agile distributed AP
- B. Fat AP
- C. AC + Fit AP
- D. Leader AP

答案： D

### 解題說明：

In Huawei campus WLAN solutions, different WLAN architectures are designed to meet varying network scales, cost requirements, and management complexity. The architecture described in this question matches the Leader AP solution.

A Leader AP can operate independently without a dedicated wireless controller, while also having the capability to manage a small number of subordinate APs. The Leader AP takes on lightweight control functions, such as basic configuration management and simple roaming coordination among the managed APs. This allows wireless users to roam between APs with minimal service interruption, meeting basic mobility requirements.

According to HCIP Datacom Campus Network documentation, the Leader AP architecture is characterized by low deployment cost and simple maintenance. Since no separate AC is required and the number of APs is limited, network planning and configuration are straightforward. This significantly reduces the technical skill level required for daily operation and maintenance, making it suitable for small campuses, retail stores, branch offices, and small enterprises.

In contrast, Fat APs operate completely independently and do not support centralized roaming management. AC

+ Fit AP architectures are designed for medium to large networks and require higher investment and professional maintenance. Agile distributed AP solutions focus on centralized APs and RUs, which do not align with the independent AP management described.

Therefore, the WLAN architecture that best fits the given characteristics is Leader AP, making option A the correct answer.

### 問題 #308

In the OSPF protocol for wide area networks, what is the core function of the "NSSA (Not-So-Stubby Area)"?

- A. Prohibit the publication of Type 5 LSAs within the area; only Type 7 LSAs (NSSA external routes) are allowed.
- B. Disable OSPF authentication and simplify configuration.
- C. Achieve indirect connection between non-backbone regions and Area 0.
- D. Allow the advertising of Type 5 LSAs (AS external routes) within the area.

答案: A

### 問題 #309

(Which of the following are the typical deployment scenarios when iMaster NCE-Campus is used to deploy a network?)

- A. Branch network
- B. VXLAN Fabric network
- C. Campus network
- D. Small-sized network

答案: B,C

解題說明:

iMaster NCE-Campus is Huawei's centralized management and control platform specifically designed for campus network scenarios. According to HCIP Datacom Campus Network documentation, its primary purpose is to provide unified planning, automated deployment, policy control, and intelligent O&M for campus environments. Therefore, campus networks are one of the most typical and core deployment scenarios for iMaster NCE-Campus.

In addition, iMaster NCE-Campus is widely used to deploy VXLAN Fabric networks within campuses.

VXLAN Fabric is a key technology for building scalable, virtualized, and multi-tenant campus networks.

iMaster NCE-Campus simplifies VXLAN Fabric deployment by automating underlay and overlay configuration, VNI creation, VNI assignment, and BGP EVPN policy distribution. This makes VXLAN Fabric networks another standard and typical deployment scenario supported by the platform.

Branch networks are not considered a typical deployment scenario for iMaster NCE-Campus. Branch network management is usually handled by iMaster NCE-WAN in SD-WAN solutions, which focuses on WAN connectivity, branch access, and centralized WAN control rather than campus-oriented services.

Similarly, small-sized networks are not defined as a deployment scenario category in iMaster NCE-Campus documentation. The platform is designed for medium to large campus environments where centralized management and automation provide the most value.

Therefore, the typical deployment scenarios when using iMaster NCE-Campus are Campus networks and VXLAN Fabric networks, making options A and B the correct answers.
