And our Health-Cloud-Accredited-Professional exam braindumps will never let you down.

Salesforce Health Cloud Accredited Professional Sample Questions (Q89-Q94):

NEW QUESTION # 89

A customer wants to view medication data from Health Cloud leveraging FHIR standards. Which Health Cloud data model should a consultant use?

- A. Electronic health record (EHR) data model
- **B. Clinical data model**
- C. Virtual care data model
- D. Integrated Care Management data model

Answer: B

Explanation:

To enable viewing medication data from Salesforce Health Cloud while leveraging FHIR standards, the Clinical Data Model is the correct data model to use.

Why the Clinical Data Model?

Purpose and Design:

The Clinical Data Model in Health Cloud is specifically built to represent patient health data, including medications, allergies, conditions, and other clinical information.

It adheres to FHIR (Fast Healthcare Interoperability Resources) standards, which are widely used to facilitate the exchange of electronic health information between systems.

Medication Data Representation:

The Clinical Data Model contains FHIR-compliant objects, such as MedicationRequest and MedicationStatement, to store and retrieve information about prescribed medications, their dosages, and administration details.

FHIR Integration:

Health Cloud's Clinical Data Model supports RESTful FHIR APIs, allowing external systems to access medication data seamlessly.

FHIR compatibility ensures that medication data can be shared with third-party EHR systems and healthcare applications.

Implementation Steps:

Configuration of Medication Records:

Populate the FHIR-compliant objects with medication data, ensuring adherence to the FHIR R4 resource structure.

Use of FHIR APIs:

Enable the Clinical Summary Healthcare API or specific Medication APIs (e.g., GET /MedicationRequest) to fetch and display medication details.

Integration Testing:

Validate the FHIR-based data exchange with other systems to ensure seamless interoperability.

NEW QUESTION # 90

A UX designer wants to change the formatting of an OmniStudio FlexCard field element to have a font of Times New Roman with a

red color.

What are two ways the designer should make the changes?

Choose 2 answers

- **A. Make edits to Field Style.**
- B. Made edits to Setup Panel.
- C. Make edits to Field Properties.
- **D. Write custom CSS.**

Answer: A,D

Explanation:

To change the formatting of a field element in an OmniStudio FlexCard to use the Times New Roman font and a red color, the following approaches are viable:

1. Write Custom CSS (B):

Custom CSS can be applied to define specific styling for field elements in a FlexCard.

CSS rules can specify the font family (Times New Roman) and color (red) precisely, providing complete control over design details.

Example:

```
.my-custom-class {  
font-family: "Times New Roman", serif;  
color: red;  
}
```

This CSS class can be referenced in the FlexCard configuration.

2. Make Edits to Field Style (D):

The Field Style section in the FlexCard Designer allows designers to set styling properties directly.

Font family and color are common options available in the Field Style configuration, making it straightforward to apply basic formatting changes without writing code.

Why Other Options Are Incorrect:

A . Make edits to Field Properties: Field Properties control functional aspects of the field (e.g., field type or source) rather than styling.

C . Make edits to Setup Panel: The Setup Panel configures overall FlexCard settings but does not handle individual field styling.

Custom Styling in OmniStudio

NEW QUESTION # 91

Bloomington Caregivers has more than 1 million patients and each patient has an average of 10 claims a year, which are maintained in an external claims system. Management would like their agents to view all the claims of patients in Salesforce on demand when they open the patient's record.

What should a consultant recommend as the appropriate integration pattern to achieve this?

- A. Add a nightly job to fetch all the claims from the external system and store them In Salesforce.
- B. Make a callout on demand to the external system and store the claims data against the patient record.
- C. Use an Enterprise Service Bus (ESB) to load all the claims data from the external system into Salesforce.
- **D. Configure the claims system as an external data source and leverage external objects with the claims data.**

Answer: D

Explanation:

Using External Objects is the most efficient integration pattern for managing large volumes of data, such as claims. In this scenario, the claims data resides in an external system, and fetching 10 million records annually into Salesforce is neither scalable nor cost-effective. External Objects allow Salesforce users to access the data on demand without storing it in Salesforce.

Key Features of External Objects:

Real-Time Access: Fetches claims data directly from the external system when a patient's record is accessed.

Storage Efficiency: Avoids consuming Salesforce storage limits by not importing the data.

Flexible Integration: External data sources such as OData can be configured to integrate with Salesforce.

Why Other Options Are Incorrect:

A . Nightly Job: Importing all claims into Salesforce daily would require excessive storage and processing resources.

B . ESB Load: Loading claims into Salesforce via an ESB introduces similar storage concerns as Option A.

C . Callout on Demand: While possible, storing claims data in Salesforce after a callout defeats the purpose of on-demand

integration.

Integrating External Data with Salesforce Connect

NEW QUESTION # 92

Bloomington Caregivers needs to easily view all of the complex associations between patients, personal relationships, healthcare practitioners, other people, and organizations in healthcare, Which Health Cloud feature should a consultant leverage to meet this requirement?

- A. Patient Card
- B. Care Team
- C. Actionable Relationship Center
- D. Enhanced Timeline

Answer: C

Explanation:

Step-by-Step

Feature Overview:

The Actionable Relationship Center (ARC) in Salesforce Health Cloud is specifically designed to give healthcare organizations a graphical and interactive way to visualize, manage, and act on complex relationships among people (patients, caregivers, practitioners) and organizations.

Source: Administer Health Cloud - Actionable Relationship Center

Complex Associations:

ARC supports multiple relationship types, including personal, clinical, and organizational connections, enabling users to easily view and manage these associations in a single, unified interface.

Exact Extract:

"With Actionable Relationship Center, care coordinators and other users can view, create, and manage the relationships between patients, their care teams, household members, and service providers. The ARC visualization tool shows complex relationships between people and organizations." Reference:

User Experience:

The visual nature of ARC allows users to not only see but also take actions on relationships (for example, add new relationships or navigate directly to related records) without leaving the ARC view. This functionality is not provided by the Patient Card, Care Team, or Enhanced Timeline, which focus on other aspects of patient information or care.

Differentiation from Other Features:

Patient Card: Displays a summarized view of patient details and care info.

Care Team: Manages members involved in a patient's care but does not visualize all associations.

Enhanced Timeline: Focuses on displaying chronological care events.

Conclusion:

For visualizing and acting on all types of relationships-personal, practitioner, organizational, and more-the Actionable Relationship Center is the recommended and officially documented Health Cloud feature.

NEW QUESTION # 93

Bloomington Caregivers has configured the Provider Network Management add-on license. Some of the users are reporting that they are unable to access some of the new functionality.

Which two permission sets should an administrator ensure are assigned so the users can access Provider Network Management?

- A. Health Cloud Standard permission set
- B. Provider Network Management permission set
- C. Health Cloud Foundation permission set
- D. Health Cloud Utilization Management permission set

Answer: A,B

Explanation:

The two permission sets that an administrator should ensure are assigned so the users can access Provider Network Management are Health Cloud Standard permission set and Provider Network Management permission set. Health Cloud Standard permission set grants users access to Health Cloud features, such as Care Team, Care Plan, Timeline, etc. Provider Network Management

permission set grants users access to Provider Network Management features, such as Provider Search, Provider Relationship Card, etc.

NEW QUESTION # 94

.....

Our products boost 3 versions and varied functions. The 3 versions include the PDF version, PC version, APP online version. You can use the version you like and which suits you most to learn our Health-Cloud-Accredited-Professional study materials. The 3 versions support different equipment and using method and boost their own merits and functions. For example, the PC version supports the computers with Window system and can stimulate the real exam. Our products also boost multiple functions which including the self-learning, self-evaluation, statistics report, timing and stimulation functions. Each function provides their own benefits to help the clients learn the Health-Cloud-Accredited-Professional Study Materials efficiently. For instance, the self-learning and self-evaluation functions can help the clients check their results of learning the Health-Cloud-Accredited-Professional study materials.
