

# Free PDF HP - HPE7-A07 - Efficient Aruba Certified Campus Access Mobility Expert Written Exam Valid Exam Camp Pdf

P.S. Free 2026 HP HPE7-A07 dumps are available on Google Drive shared by TestkingPass: <https://drive.google.com/open?id=1sFGDgL4K1AKyX8NcbbHOINWunhe-iKIL>

Since different people have different preferences, we have prepared three kinds of different versions of our HPE7-A07 practice test: PDF, Online App and software. Last but not least, our customers can accumulate exam experience as well as improving their exam skills in the mock exam. And your success is 100% guaranteed for our pass rate of HPE7-A07 Exam Questions is as high as 99% to 100%. And We have put substantial amount of money and effort into upgrading the quality of our HPE7-A07 Exam Preparation materials.

To meet the different and specific versions of consumers, and find the greatest solution to help you review, we made three versions for you. Three versions of HPE7-A07 prepare torrents available on our test platform, including PDF version, PC version and APP online version. The trait of the software version is very practical. It can simulate real test environment, you can feel the atmosphere of the HPE7-A07 Exam in advance by the software version, and install the software version several times. PDF version of HPE7-A07 exam torrents is convenient to read and remember, it also can be printed into papers so that you are able to write some notes or highlight the emphasis. PC version of our HPE7-A07 test braindumps only supports windows users and it is also one of our popular types to choose.

## HPE7-A07 Test Sample Online, Sample HPE7-A07 Questions Answers

Our APP online version of HPE7-A07 exam questions has the advantage of supporting all electronic equipment. You just need to download the online version of our HPE7-A07 preparation dumps, and you can use our HPE7-A07 study quiz by any electronic equipment. We can promise that the online version will not let you down. We believe that you will benefit a lot from it if you buy our HPE7-A07 training materials.

## HP Aruba Certified Campus Access Mobility Expert Written Exam Sample Questions (Q21-Q26):

### NEW QUESTION # 21

A customer's infrastructure is set up to use both primary and secondary gateway clusters on the SSID profile based on best practices. What is a valid cause for having an equal split in APs connected to the primary and secondary gateway clusters?

- A. The secondary gateway cluster is homogeneous
- B. The primary gateway cluster is up. out some APs cannot reach the secondary gateway cluster. These APs would connect to the secondary gateway cluster
- C. The secondary gateway cluster is heterogeneous
- **D. The primary gateway cluster is up. out some APs are unable to reach the primary gateway cluster. These APs would connect to the secondary gateway cluster**

**Answer: D**

Explanation:

In a high availability setup where both primary and secondary gateway clusters are present, APs are typically designed to connect to the primary cluster. If the APs are equally split between the primary and secondary, this may indicate that some APs cannot reach the primary cluster due to connectivity issues or reachability constraints, thus falling back to the secondary cluster.

### NEW QUESTION # 22

What should be defined on the Edge-1 to establish valid BGP routing between agg-sw1 and agg-sw2 using BGP protocol using the IP addresses above?

□

- **A. OPTION D**
- B. OPTION A
- C. OPTION B
- D. OPTION C

**Answer: A**

Explanation:

In the design shown:

\* The BGP peering between agg-sw1 and agg-sw2 is being established using loopback interfaces as the BGP neighbor addresses (10.0.0.2 and 10.0.0.4)

\* When BGP peering uses loopbacks, you must configure the BGP session to originate updates from the same loopback interface that the neighbor's address resolves to Otherwise, the TCP session fails because:

The source IP does not match the configured neighbor remote-IP which is based on the loopback address Aruba AOS-CX requirement:

"When configuring eBGP or iBGP neighbors using loopback interfaces, apply update-source <loopback> under the IPv4 unicast address family so BGP uses the correct source interface for peering."

### NEW QUESTION # 23

Refer to the exhibit.

□

Which statement is true?

- A. The client used an incorrect passphrase
- B. The client is using BSS Fast Transition
- C. The client performed passive scanning
- **D. The client is failing 802.1X authentication**

**Answer: D**

Explanation:

The exhibit shows a series of 802.1X authentication steps with multiple "Deauthentication" frames, which indicate that the client is not successfully completing the authentication process. Since the frames show repeated attempts at authentication followed by deauthentication, this suggests that the client is failing the 802.1X authentication process, which is required for network access in a WPA2/WPA3-Enterprise security environment.

### NEW QUESTION # 24

After onboarding three new AOS-10 gateways using the full-setup method into the same HPE Aruba Networking Central group, a customer cannot log in to one of the gateways using the HPE Aruba Networking Central remote console due to an incorrect password.

What is causing this issue?

- A. The admin password created during the full-setup process is not configured to allow the remote console access
- B. The admin password created at the HPE Aruba Networking Central group level has expired
- C. The admin password created using full-setup does not match the global HPE Aruba Networking Central admin password
- **D. The admin password created during the full-setup process does not match the HPE Aruba Networking Central group admin password**

**Answer: D**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract of HPE Aruba Networking Switching:

When an AOS-10 gateway is onboarded into Aruba Central using the Full-Setup method, a local admin password is defined during the setup wizard on the gateway itself. Later, when the gateway joins an existing Aruba Central group, the group-level configuration (which includes the admin password defined for that group) is automatically pushed down to all devices in that group for configuration consistency.

However, if the password defined during full-setup is different from the admin password defined in the Aruba Central group, the synchronization process can cause a mismatch between the local device password and the one expected by Central. This mismatch prevents remote console login from working properly because Aruba Central attempts to authenticate to the gateway using the group-level admin credentials, not the local credentials from full-setup.

Exact Extract from HPE Aruba Networking Switching and Aruba Central Configuration Documents:

"During onboarding, the admin password configured at the group level in Aruba Central is applied to all devices in the group. If a device is added using full-setup with a different password, it may fail Central-initiated authentication functions such as remote console."

"When gateways are provisioned using the full-setup workflow, the local administrator password must match the group-level administrator credentials in Aruba Central to allow remote console and CLI access through Central." Therefore, the issue arises because the full-setup password for the gateway does not match the group admin password defined in Aruba Central, resulting in the 'incorrect password' error when attempting to access the gateway remotely through Central.

Why the Other Options Are Incorrect:

\* A. The full-setup admin password is valid for remote access; there is no separate configuration option that "allows" or "disallows" remote console use.

"Remote console access uses the same admin account configured for device login; there is no additional enablement required."

\* B. Aruba Central admin passwords do not expire by default. Group-level admin credentials are persistent configuration items, not time-based credentials.

"Local and group administrator passwords are static until manually changed."

\* C. There is no "global Aruba Central admin password" used to authenticate to devices; authentication is performed using per-group or per-device credentials configured in Central.

"Each Aruba Central group maintains its own admin credentials that are propagated to member devices; there is no single global password for all groups." References of HPE Aruba Networking Switching Documents or Study Guide:

\* ArubaOS 10.5.0 Gateway Deployment and Configuration Guide - "Onboarding using Full Setup" and "Group-Level Configuration Synchronization."

\* Aruba Central Device Management Guide - "Group Admin Credentials and Remote Console Access."

\* Aruba AOS 10 Campus Gateway Installation and Setup Guide - "Matching Group Admin Passwords for Central-Managed Devices."

## NEW QUESTION # 25

Which data transmission method provides the most efficient use of airtime for VoIP traffic?

- A. FDMA
- B. OFDM
- C. TWT
- **D. MU-MIMO**

**Answer: D**

Explanation:

MU-MIMO (Multi-User, Multiple Input, Multiple Output) provides the most efficient use of airtime for VoIP traffic among the options listed. MU-MIMO allows multiple users to receive multiple data streams simultaneously, improving the overall efficiency of the network, especially in dense environments where VoIP applications need consistent and reliable connectivity.
