SY0-701 Latest Test Online & Exam SY0-701 Prep

PassTorrent offers CompTIA SY0-701 practice tests for the evaluation of CompTIA Security+ Certification Exam exam preparation. CompTIA SY0-701 practice test is compatible with all operating systems, including iOS, Mac, and Windows. Because this is a browser-based SY0-701 Practice Test, there is no need for installation.

CompTIA Security+ Certification Exam Sample Questions (Q532-Q537):

NEW QUESTION # 532

While a school district is performing state testing, a security analyst notices all internet services are unavailable. The analyst discovers that ARP poisoning is occurring on the network and then terminates access for the host. Which of the following is most likely responsible for this malicious activity?

- A. Nation-state
- B. Unskilled attacker
- C. Shadow IT
- D. Insider threat

Answer: D

NEW QUESTION # 533

Which of the following allows a systems administrator to tune permissions for a file?

- A. Access control list

- B. Least privilege
- C. Patching
- D. Configuration enforcement

Answer: A

Explanation:

Detailed Access control lists (ACLs) allow administrators to fine-tune file permissions by specifying which users or groups have access to a file and defining the level of access. Reference: CompTIA Security+ SY0-701 Study Guide, Domain 3: Security Architecture, Section: "Access Control Mechanisms".

NEW QUESTION # 534

A certificate authority needs to post information about expired certificates. Which of the following would accomplish this task?

- A. PKI
- B. TPM
- C. CSR
- **D. CRL**

Answer: D

Explanation:

A Certificate Revocation List (CRL) is a digitally signed list maintained by a Certificate Authority (CA) that contains revoked or expired certificates. This prevents clients from trusting compromised or outdated certificates.

TPM (A) is a hardware security module, unrelated to certificate revocation.

PKI (C) is the overall system managing digital certificates, but it does not store revocation lists.

CSR (D) is a request to obtain a certificate, not to revoke one.

Reference:

CompTIA Security+ SY0-701 Official Study Guide, Security Architecture domain.

NEW QUESTION # 535

Which of the following is a reason environmental variables are a concern when reviewing potential system vulnerabilities?

- A. Environmental variables will determine when updates are run and could mitigate the likelihood of vulnerability exploitation.
- B. In-memory environmental variable values can be overwritten and used by attackers to insert malicious code.
- **C. The contents of environmental variables could affect the scope and impact of an exploited vulnerability.**
- D. Environmental variables define cryptographic standards for the system and could create vulnerabilities if deprecated algorithms are used.

Answer: C

Explanation:

Environmental variables store configuration settings, paths, and other system-related information that applications and processes use. If an attacker gains access to these variables, they could manipulate them to alter application behavior, gain unauthorized access, or escalate privileges. For example, an attacker could modify the PATH variable to execute malicious programs instead of legitimate ones. This can significantly increase the scope and impact of an exploited vulnerability, making it a major security concern.

NEW QUESTION # 536

An employee receives a text message that appears to have been sent by the payroll department and is asking for credential verification. Which of the following social engineering techniques are being attempted? (Choose two.)

- A. Misinformation
- B. Phishing
- C. Typosquatting
- D. Vishing
- **E. Impersonation**
- **F. Smishing**

Answer: E,F

Explanation:

Explanation

Smishing is a type of social engineering technique that uses text messages (SMS) to trick victims into revealing sensitive information, clicking malicious links, or downloading malware. Smishing messages often appear to come from legitimate sources, such as banks, government agencies, or service providers, and use urgent or threatening language to persuade the recipients to take action¹². In this scenario, the text message that claims to be from the payroll department is an example of smishing.

Impersonation is a type of social engineering technique that involves pretending to be someone else, such as an authority figure, a trusted person, or a colleague, to gain the trust or cooperation of the target. Impersonation can be done through various channels, such as phone calls, emails, text messages, or in-person visits, and can be used to obtain information, access, or money from the victim³⁴. In this scenario, the text message that pretends to be from the payroll department is an example of impersonation.

A: Typosquatting is a type of cyberattack that involves registering domain names that are similar to popular or well-known websites, but with intentional spelling errors or different extensions. Typosquatting aims to exploit the common mistakes that users make when typing web addresses, and redirect them to malicious or fraudulent sites that may steal their information, install malware, or display ads⁵⁶. Typosquatting is not related to text messages or credential verification.

B: Phishing is a type of social engineering technique that uses fraudulent emails to trick recipients into revealing sensitive information, clicking malicious links, or downloading malware. Phishing emails often mimic the appearance and tone of legitimate organizations, such as banks, retailers, or service providers, and use deceptive or urgent language to persuade the recipients to take action⁷⁸. Phishing is not related to text messages or credential verification.

D: Vishing is a type of social engineering technique that uses voice calls to trick victims into revealing sensitive information, such as passwords, credit card numbers, or bank account details. Vishing calls often appear to come from legitimate sources, such as law enforcement, government agencies, or technical support, and use scare tactics or false promises to persuade the recipients to comply⁹. Vishing is not related to text messages or credential verification.

F: Misinformation is a type of social engineering technique that involves spreading false or misleading information to influence the beliefs, opinions, or actions of the target. Misinformation can be used to manipulate public perception, create confusion, damage reputation, or promote an agenda. Misinformation is not related to text messages or credential verification.
