## Adobe AD0-E725 Valid Test Book & Valid AD0-E725 Vce

If you buy online classes, you will need to sit in front of your computer on time at the required time; if you participate in offline counseling, you may need to take an hour or two on the commute to class. But if you buy AD0-E725 exam material, things will become completely different. Adobe Commerce Developer Expert study questions will provide you with very flexible learning time. Unlike other learning materials on the market, AD0-E725 exam guide has an APP version. You can download our app on your mobile phone. And then, you can learn anytime, anywhere. Whatever where you are, whatever what time it is, just an electronic device, you can practice. With Adobe Commerce Developer Expert study questions, you no longer have to put down the important tasks at hand in order to get to class; with AD0-E725 Exam Guide, you don't have to give up an appointment for study. Our study materials can help you to solve all the problems encountered in the learning process, so that you can easily pass the exam.

## Adobe Commerce Developer Expert Sample Questions (Q43-Q48):

### NEW QUESTION # 43

A Developer is notified that custom API results are not cached, which is causing additional delays. What are two potential causes for this behavior? (Choose two.)

- A. The request is using HTTP GET.
- **B. The request is using HTTP PUT.**
- C. The request is using HTTP HEAD.
- **D. The request is using HTTP POST.**

**Answer: B,D**

Explanation:

Adobe Commerce API caching (including GraphQL and REST) works only for idempotent requests such as HTTP GET. C (POST) and D (PUT) are not cacheable because they are used for creating or updating resources.

A (GET) is cacheable.

B (HEAD) is technically idempotent, but not commonly used in Adobe Commerce APIs.

HTTP/1.1 RFC 7231 - Cacheable methods

#### NEW QUESTION # 44

An Adobe Commerce Developer creates a module that adds a product attribute via a data patch.

Adhering to best practices, how should the Developer remove this product attribute when the module is uninstalled?

- A. Delete the custom attribute directly from the database.
- B. Create a new CLI command that needs to be executed before the `bin/magento module:uninstall Vendor_ModuleName`.
- C. Make the patch implement `Magento\Framework\Setup\Patch\PatchRevertableInterface` with the `revert()` method in it.

**Answer: C**

#### NEW QUESTION # 45

A Developer applies multiple quality patches to an Adobe Commerce Cloud store. After deployment, the Developer discovers that one of the patches is causing issues.

What is the correct procedure to safely remove or revert the problematic quality patch?

- A. Execute command in `magento-cloud`:  
`./vendor/bin/ece-patches revert <patch-id>`
- B. Delete the quality patch from the file `magento.app.yaml`.
- C. Delete the quality patch from the file `magento.env.yaml`.

**Answer: A**

Explanation:

The Quality Patches Tool (QPT) in Adobe Commerce Cloud provides a way to apply and revert patches. To safely remove a problematic patch, run:

```
/vendor/bin/ece-patches revert <patch-id>
```

This ensures that the patch is properly removed without affecting other applied patches.

A and C are incorrect because patches are not managed via YAML config files.

#### NEW QUESTION # 46

A client requests changes to their Pro Staging and Production environments. They supply a Developer with different domains for new websites to be created with the goal of expanding operations to multiple countries, doubling the current number of SKUs, and adding more customer groups.

Which two issues should the Developer anticipate based on the requested changes? (Choose two.)

- A. Catalog data expands as the number of websites and stores are increased.
- B. Additional stores can lead to a longer indexing process and slower response times for noncached catalog pages.
- C. Recreate hierarchy navigation for every new website.
- D. Multiple websites may require duplicating custom functionality for each store, which increases code redundancy.

**Answer: A,B**

#### NEW QUESTION # 47

A client uses a straightforward custom payment method which allows a pre-generated code to be used as payment. The code is provided directly to customers through email and other communications. The client reports a problem with someone fraudulently guessing the codes correctly. They want to implement an API check that ensures the code exists in their system when the code is applied.

Where should the Developer add this change?

- A. Create an after plugin on the canAuthorize method and implement the API check there.
- B. Create a before plugin on the canCapture method and implement the API check there.
- C. Create a custom validator that will check for this code at the time the order is placed.

**Answer: C**

Explanation:

The correct approach is to implement a custom payment validator. Validators ensure that the payment method data is validated at the checkout process, before the order is placed.

A (canCapture) is used for payment capture operations, not code validation.

C (canAuthorize) is used for authorization checks, but not the correct place for validating custom input codes.

B is correct because validators run at checkout, ensuring only valid codes are accepted.
