101-500 Valid Practice Questions & Latest 101-500 Braindumps Questions

The questions and answers of our 101-500 study tool have simplified the important information and seized the focus and are updated frequently by experts to follow the popular trend in the industry. Because of these wonderful merits the client can pass the exam successfully with high probability. It is easy for you to pass the exam because you only need 20-30 hours to learn and prepare for the exam. You may worry there is little time for you to learn the 101-500 Study Tool and prepare the exam because you have spent your main time and energy on your most important thing such as the job and the learning and can't spare too much time to learn.

The LPIC-1 Exam 101, Part 1 of 2, version 5.0 consists of 60 multiple-choice and fill-in-the-blank questions that must be completed within 90 minutes. 101-500 Exam is computer-based and can be taken at authorized testing centers worldwide. The passing score for the exam is 500 out of 800.

Lpi LPIC-1 Exam 101, Part 1 of 2, version 5.0 Sample Questions (Q265-Q270):

NEW QUESTION # 265

What is contained on the EFI System Partition?

- A. The Linux default shell binaries
- B. The first stage boot loader
- C. The Linux root file system

- D. The user home directories
- E. The default swap space file

Answer: B

Explanation:

NEW QUESTION # 266

Which of the following commands overwrites the bootloader located on /dev/sda without overwriting the partition table or any data following it?

- A. `dd if=/dev/zero of=/dev/sda bs=512 count=1`
- B. `dd if=/dev/zero of=/dev/sda bs=512`
- C. `dd if=/dev/zero of=/dev/sda bs=440`
- D. `dd if=/dev/zero of=/dev/sda bs=440 count=1`

Answer: D

Explanation:

Explanation

The `dd` command is used to copy data from one device or file to another, with optional parameters to specify the block size (`bs`), the number of blocks to copy (`count`), and other options. The bootloader is typically located in the first 440 bytes of the disk, which is the Master Boot Record (MBR) area. The MBR also contains the partition table, which starts at byte 446 and occupies 64 bytes. Therefore, to overwrite the bootloader without affecting the partition table or any data following it, the command should copy 440 bytes from /dev/zero (a special device that provides null bytes) to /dev/sda (the disk device) and stop after one block. This is achieved by the command: `dd if=/dev/zero of=/dev/sda bs=440 count=1` References:

* Master Boot Record

NEW QUESTION # 267

Typically, which top level system directory is used for files and data that change regularly while the system is running and are to be kept between reboots? (Specify only the top level directory)

- A. /var/
- B. var/
- C. Var
- D. /var

Answer: D

Explanation:

The top-level system directory that is used for files and data that change regularly while the system is running and are to be kept between reboots is /var. The /var directory contains variable data that changes in size as the system runs. For instance, log files, mail directories, databases, and printing spools are stored in /var. These files and data are not temporary and need to be preserved across system reboots. The /var directory is one of the few directories that are recommended to be on a separate partition, according to the Filesystem Hierarchy Standard (FHS)1. This is because the /var directory can grow unpredictably and fill up the / partition, which can cause system instability or failure. By having /var on a separate partition, we can limit the amount of disk space that can be used by variable data and prevent users from affecting the / partition. The /var directory is also a common target for malicious attacks, so having it on a separate partition can improve the security and isolation of the system. References:

NEW QUESTION # 268

Which `chown` command changes the ownership to dave and the group to staff on a file named data.txt?
`chown dave:staff data.txt`

- A. `chown dave:staff data.txt`

- B. chown dave+staff data.txt
- C. chown --user dave --group staff data.txt
- D. chown -u dave -g staff data.txt
- E.

Answer: E

NEW QUESTION # 269

Which of the following is a limitation of the cut command?

- A. The cut command only works on ASCII text.
- B. The cut command cannot reorder fields.
- C. The cut command can only select output by field position.
- D. The cut command cannot use different input and output delimiters.

Answer: B

Explanation:

The cut command is used to extract selected portions of each line of a file or a stream. The -f option is used to specify the fields to be extracted, separated by commas. The -d option is used to specify the delimiter that separates the fields. The default delimiter is the tab character. The cut command can only select output by field position, not by field content. The cut command can also work on non-ASCII text, such as UTF-8 encoded text. The cut command can use different input and output delimiters, but only if the output delimiter is specified by the --output-delimiter option. The cut command cannot reorder fields, meaning that the output fields will always appear in the same order as the input fields. To reorder fields, other commands such as awk or sed can be used.
